mitting the return phase to be made. For this reason little fatigue accompanies such movements. They continue in an uninterrupted series of pulsations and are grouped or measured by the number of pulses required to complete the movement. Swinging movements easily fall into a one-two-three rhythm due to the placement of accent inherent in pendular action. They are very soothing in effect and their rhythm has the power to stimulate repetition to an almost hypnotic degree.

The rhythmical pendular to and fro character of swinging movement is easily changed to a to and fro "pistonlike" quality, if the moving part, such as an arm, is swung forward and pulled back before momentum is overcome. Such movements are stimulating yet fatiguing because of muscular effort necessary to check momentum and change direction.

The pendular character of the swing may also be changed to a more *sustained* quality by the introduction of tension in the support of the weight of the moving body instead of abandoning it to free pendular action. Sustained movements are executed with a steady release of energy maintaining an even tension throughout their execution. They have a feeling of restraint and are rich in associative meaning. On the other hand a slackening of tension introduces the quality of relaxation which may be present in varying degrees from the relaxation of *flowing,* undulating motion to a complete relaxation resulting in a "collapsing" either of unit parts of the body or the whole body resulting in a "fall" as in a faint. A falling movement may be executed with more tension than relaxation in which case a more sustained quality is imparted to the fall.

Contrasted with the uninterrupted flow of energy release of swinging movements is the sudden checking of movement by a vigorous muscle contraction, which produces movements of a jerky, explosive, *percussive* quality. Such movements usually have a swinging and sustained preparatory movement and are abruptly completed by an equalization of muscle tension causing the moving parts of the whole body to be steadied and held in suspension seemingly without effort. Or the contraction may occur almost without a perceptible retard imparting a puff-like accentuation like in a golf stroke and permitting the movement to continue to its full range of action. If a series of sharp muscular contractions are used to break up a movement cycle into a series of abrupt starts and stops, there results a series of disconnected "staccatto-like" actions each one marked by a sharp emphasis. If such a series proceeds at a sufficiently rapid rate, its quality is changed to a *vibratory* effect. Tension is an essential feature for the effective execution of percussive movements.

If a muscle contraction occurs so as to place an accent in an unexpected place within a movement series, the element of *syncopation* is introduced. Syncopated movements are executed by beginning action on an unaccented interval and continuing its duration through the following accented one. They have a rhythmic structure whose sensations are experienced against those sensations of reguliarity of long established and customary patterns—thus destroying the monotony of regularity. Although syncopation destroys the feeling of the grouping accent of the underlying physiological beat, it does not destroy its rhythmic pull. It is only by its degree of deviation from the expected sequence of time and stress intervals that a movement is sensed as being syncopated. A syncopated muscular contraction is sensed as a sudden and unexpected delay in the progression of movement pulsations. This element of shock and surprise is highly stimulating and is most likely the reason for the delight and fascination in syncopated movement.

Any continued action will include several of these qualities, and more than one may be present in the same motor act. It is as one or the other dominates that a movement is said to be of a certain type. By changing the dynamics of an action its "feel"or quality is changed. Emphasis should not be on the movement we see as a movement, but upon what we are made to feel by the qualities revealed in its performance. For example: it is not significant that an arm executes a swinging movement. The important fact lies in what is evoked by the quality of "swingingness" projected by the swinging arm. These qualities, inherent in dynamic movement structure, are the emotive forces that arouse emotional forces as opposed to being expressive of them. Significant dance movements are emotive and not emotional. See rhythm; kinesthetic sense; tension; movement. —M.N.H'D.

**Queen Anne architecture.** The architecture associated with the brief reign of Queen Anne, from 1702-1714, marks the close of a century of compromise in England between the baroque, borrowed heterogeneously from Italy and Holland and championed most successfully by Inigo Jones and Sir Christopher Wren, and academism. Before the purer 18th cent. forms of Gibbs and Wood became paramount, the baroque enjoyed an impressive finale in the monumental edifice of Blenheim Palace, erected between 1705 and 1724 in honor of the Duke of Marlborough's military triumph at Blenheim. It at once represents the power, prosperity and increasing national consciousness of England and dominates the architectural output of the period. The designer was Sir John Vanbrugh (1666-1726), the leading architect of the reign, who also created the vast plan for Castle Howard. In Blenheim Palace baroque picturesqueness, spectacular compositions of masses, broken skylines, and interrelated forms are presented on a grand opera scale; and the interior, the antithesis of domestic intimacy, is overwhelmingly impressive. Yet even Vanbrugh, when he collaborated with Nicholas Hawksmoor on the Clarendon Press building at Oxford in 1710, prophesied through a strictly classical portico the academic triumph.

Less ostentatious but more enduring forces were at work in the realm of interior design. The Queen Anne style of furniture, with its graceful and elegant curves, its unprecedented modern upholstery and its fantastically gay and colorful chinoiserie lacquers—all parallel to the rising Rococco in France—inaugurated England's Golden Age of furniture design, and it remains to this day one of the favorite modes in the English-speaking world. **radio and music.** It is impossible to overstate the importance of radio broadcasts as a factor in our musical culture. Radio transmits music to rural districts and small communities which were never visited by touring concert artists. It provides that element of repetition which is so necessary to the appreciation of symphonic music. It furnishes a point of contact with foreign cultures as well as the many diverse elements which have entered into our own musical culture.

Our own use of the radio is conditioned by the organization of the broadcasting industry in this country. It is perhaps useful to compare our own system with that of Nazi Germany and Great Britain. Germany under the Nazi regime has utilized the radio largely as an instrument of propaganda. They have thus developed the **folk-radio,** a receiving set of limited receptivity, which is only capable of reproducing broadcasts from domestic stations. In Great Britain the control of the air has been retained for the government through the agency of the British Broadcasting Corporation. In the U. S. A., however, broadcasting has been allowed to pass into the hands of powerful corporations which sell time on the air for the purpose of advertising various firms and products.

This pattern has had profound effects on the character of American broadcasting. It has in many cases resulted in musical programs at an inferior level of taste since a sponsor might feel (and possibly with reason) that a more general response might be secured in this manner. It has produced the "commercial" which, even in those cases when it is neither fulsome nor blatant in tone, is hardly a happy preliminary to the musical pleasures which follow. It has tended to foster timidity since it is undoubtedly safer to use music in a familiar style than to seek novelty in form or content.

It was, however, in pre-Nazi Germany that the possibilities of radio as a new channel of expression for the creative musician were first exploited. A work for chamber orchestra and organ commissioned from Paul Hindemith as early as 1927 was broadcast in 1928. In 1929 a monthly broadcast featured original music written esp. for the radio. Among the composers whose works were thus broadcast were Franz Schreker, Paul Graener, Max Bütting (who became a specialist in this field), and Kurt Weil. Courses in the various phases of radio music were offered by Hindemith, Butting, and others. A group of twelve north German composers also wrote music chiefly for chamber orchestra which was presented in broadcasts originating from Hamburg.

Peculiarities of scoring such as the omission of double basses and second violins, the cultivation of an open and transparent or-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

chestral texture, the avoidance of thick and massive tutti passages, were in part concessions to the limited range and sensitivity of early broadcasting apparatus. Obviously, these very limitations made for distinctive musical qualities which have largely vanished with the special conditions which brought them into being.

In France an early competition for a radiogenic score was won (in 1927) by Florent Schmitt with his *Çançunik*. In general, however, both France and England seem to have been slower to utilize the resources of broadcasting for the various composer than was Germany.

The earliest period of broadcasting in the U. S. A. reached an audience of enthusiastic amateurs who were likely to be more concerned with the call letters of the station received than the content of the broadcast. In a remarkably short time, however, musicians and musical organizations began to realize the growing possibilities of the medium. As early as 1923 a week of Wagnerian opera was broadcast from the Manhattan Opera House over station WJZ. In that same year the Philharmonic Symphony Orchestra was broadcast from the Lewissohn Stadium and the Goldman Band from Central Park. A gala broadcast by John McCormack and Lucrezia Bori took place on New Year's Day, 1926. By 1928 the list of famous artists who had made broadcasts was impressive indeed. The very considerable prejudice against broadcasting disappeared rapidly in view of the desirable publicity and the substantial fees which rewarded such appearances. Three educational concerts conducted by Walter Damrosch in 1928 developed into a series of weekly broadcast lecture-concerts for school children which continued over the air the work which Dr. Damrosch had long carried on in his orchestral concerts for young people. By 1930 the Sunday afternoon Philharmonic Symphony Orchestra broadcasts had commenced, thus beginning a series of concerts over the air which have played so important a part in American musical life. The broadcasts of the Metropolitan Opera Company and those of the N. B. C. Symphony Orchestra remain major musical events.

In the U. S. A., though serious music was broadcast at a relatively early date, little consideration seems to have been given the American composer till 1936. In that year the Columbia Broadcasting System commissioned six American composers to write works suitable for broadcasting. The participating composers were Aaron Copland, Roy Harris, Howard Hanson, William Grant Still, Walter Piston, and Louis Gruenberg. The radio-operas which resulted from this and succeeding commissions were esp. interesting since they were composed for the ear alone without scenic adjuncts and without the intervals for the shift of scenery which break up broadcasts of actual stage performances in such an awkward fashion. Gian-Carlo Menotti's *The Old Maid and the Thief* (1939) is a cleverly realized work though not as interesting musically as others of the series. In the summer of 1938 Howard Barlow conducted a series of American works from a much larger number of manuscripts submitted at his request. Among the composers whose works were thus performed were Paul Creston and William Schuman. Mention should also be made of the broadcasts of American music by the Rochester Philharmonic Symphony Orchestra under the direction of Dr. Howard Hanson.

Very characteristic of American radio programs is the large amount of incidental music required for dramatic programs of the most varied kinds. Much of the music composed for such programs is clever, facile, effective. Much is a synthetic pseudo-romantic product of a kind which has been made only too familiar in commercial movie scores.

The list of serious works summarized far too briefly above forms only the smallest percentage of the enormous amount of music broadcast. Popular dance music dominates the broadcasting channels. Name-bands, on the strength of their air-won prestige, have become household words. Poular singers gain tremendous and fanatically devoted followings during their day before the microphone. A popular song enjoys only the briefest period of popularity before ears of the radio audience become satiated, and another must be found.

The picture presented by modern broadcasting is extremely complex. The amount of music broadcast is almost incredibly large. The dominance of popular music is pronounced; but the actual amount, if not the proportion, of serious music broadcast is substantial. For the most part, however, music on the radio has the character of a competent commercial product. This is possibly inevitable in view of the nature of the broadcasting industry. It is quite clear that a higher level of public taste would be reflected in the quality of music broadcast since the sponsor seeks to buy good will. Since, how-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ever, the radio is the most powerful educative force in the field of music, it may well be asked whether this force will not tend to hold public taste at its own level, teaching the public to accept what it offers with occasional concessions to listeners who prefer the deeper and higher forms of music. —C.W.H.

**RADIO DRAMA.** One of the earliest attempts to use radio as a medium for dramatic expression occurred in 1922, when station WGY, Schenectady, N. Y.,. broadcast a performance of Eugene Walters' play, "The Wolf". Since then, radio drama has won an enormous daily audience, and has discovered and developed techniques peculiar to itself.

Limiting and defining the character of radio drama is the fact that it must work solely with the instruments provided by aural experience. Scene and state of mind alike must be conveyed by words or music or easily identifiable sounds.

Further, radio drama has an audience of individuals, widely separated by space and circumstance. Each listener stands in a peculiarly intimate relationship to the program which is unimpaired (and unfacilitated) by the crowd reactions common to the theatre. His interest or approbation cannot be stimulated by glamorous lights and furnishings, or the tense, somewhat uncritical excitement of a crowded auditorium. In the familiar surroundings of his own home, office or automobile, the auditor's sympathy and attention must be attracted by sound alone.

Finally, radio drama depends for its success upon the active (though perhaps unconscious) collaboration of each member of its audience. It is a truly "suggestive" art. The listener's imagination must translate sound into colour and costume; must identify the tone and accent of a voice with the size and nature of a man. The ease with which such translations and identifications are made is rather remarkable. Part of radio drama's astonishing popularity is probably due to the fact that every hearer is participating in the creation of his own enjoyment; lending from past experience the visual facts which fill out the "reality" of characters and places.

Production of a radio drama begins with the **script writer,** who provides plot and verbal characterization, in terms of the requirements of broadcast technique.

First, he must use some aural device to create in the public an "intention to listen". He may use a fanfare, theme song, or some sharp, attention-getting sound or sentence. But however he chooses to introduce his program, it is necessary for him to get on with the action almost immediately. The long, slow introductory scenes common to the theatre are useless on the air; the listener must be given intrinsically interesting development at the very beginning, or he will turn to another station.

Further, the radio writer must build his scenery out of words, music and sound-effects. To set the aural stage, he will frequently use a **narrator,** a commentator usually external to the plot, to whom are assigned lines introducing, partially describing, and sometimes explaining the place, action and characters of the play. Although his functions are usually somewhat similar to that of the "Chorus" of antiquity, the narrator may sometimes be used as the dominant figure in the action itself; subjective drama, told in the first person singular, is one of radio's distinctive achievements.

Having no visual stage to interfere with his fancy, the radio writer enjoys a freedom of movement unknown to the theatrical playwright. He can shift scenes rapidly in time and place, and make effective use of *"flash-backs",* in which past events are reproduced to explain present plot-situations. To separate scene from scene, he may use a brief musical interlude, or **bridge,** a piece of narration, or a moment of complete silence. Interesting emotional effects may be achieved by using the **montage,** in which a variety of short and perhaps superficially unrelated speeches are presented by different voices, simultaneously or in rapid succession; the total impression conveying the mood or idea intended by the author. The montage can also be used to indicate the passage of time, and may include short chords of music or interludes of sound as well as alternating or intermingled voices.

In his script, the writer must indicate where all sound effects or musical passages are to be introduced, and specify their nature and duration. Finally, he usually finds it necessary to use simple plots, uncomplicated by sub-plots or non-dramatic material. Simplicity and compression are essential to any good script.

To the **radio actor** falls the task of translating the printed script into living words With neither paint nor costume, light nor shadow to help, he must find all the equipment for producing his illusion within the range and intensity of his voice. Since his

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

speech is "overheard by", rather than "projected at" his audience, over-acting is uncongenial to radio technique.

The radio actor does not memorize his lines; instead, he reads them from the script with only a few hours (at most) of rehearsal. Consequently, he must be able to give a subtle vocal characterization almost at sight. Sometimes he is called upon to play more than one part in a single show; to **double** successfully in a variety of roles, he must be able to use different dialects convincingly, and throw his voice into various registers.

Vocal personality and sincerity, together with expert delineation of character through tone, pace, accent and volume; these are the necessary and ultimate instruments of the radio actor.

**Sound effects** play an important role in strengthening the illusion of reality in the listener's imagination. The whirring screech of a lathe, for example, immediately suggests a factory scene. Many sounds have been recorded, so that they may be reproduced realistically over the air; others must be simulated by highly trained sound-technicians. Whenever used, sound effects must be easily recognizable (or carefully identified), and integrated with the dialogue in such a manner as to be unobtrusive.

**Music** is frequently used as a sound effect, with great success in certain types of production. In emotional scenes, a musical background can heighten the dramatic impact of the lines immeasurably. Music also serves as a transition device between scenes, and is especially useful in suggesting (or "setting") moods.

The **engineer** functions as radio's stage-manager. He controls the microphones which translate sound into radio-electrical impulses, and regulates (or "balances") the volume of broadcast sound.

Radio drama depends on the collective efforts of writer, actor, sound-effects man and engineer. But the person who collects these efforts,—the *Producer,* is ultimately responsible for the success or failure of any broadcast. The producer's function is similar to that of the director in the theatre; he must cast, rehearse and unify the show, and manage to get it off the air on time.

His first responsibility is to the clock; he must use precisely the amount of time assigned him,—no more, not a second less. In radio's early days, the "stopwatch producer" was a common phenomenon; such a person was concerned only with timing his program correctly.

But the modern radio producer realizes a much more complex task. Working with the medium of simple sound, he must weave a complicated pattern of speech and speed, of music and sound-effects, to create a radio drama. A good producer can do as much for a radio play as a Ford or an Eisenstein can do for a movie. And as in the movies, writers sometimes handle their own production; this is desirable, since it is often necessary to cut or re-write portions of the script during rehearsal.

TYPES OF RADIO DRAMA. Almost everything which can be broadcast may involve dialogue and actors, but radio drama generally falls into several loose classifications, which will be discussed in quantitative order. It must be remembered, however, that there are undoubted exceptions to every rule and judgment made below.

(1) In terms of time, the biggest thing in radio is the **serial** (often called **soap opera** because so many serials are sponsored by soap companies). More programs of this sort are heard daily than any other single dramatic type.

The **radio serial** is a continued story which is enacted either in consecutive chapters, or in a related series of independent episodes each of which is a complete playlet in itself. In the consecutive variety, each chapter begins with a climax, contains a solution of the problem situation obtaining at the beginning, and rises to a second unresolved climax near the end, so that the listener will be intrigued into tuning in for the next development. Most serials present 5 fifteen-minute chapters each week, broadcast during the daytime or early evening. Some, however, are weekly half-hour shows. The endurance of writer, audience, or sponsor constitutes the only limit to the number of chapters.

Serial characters, like almost all dramatic characters in radio, are simple, rather than complex; definite, immediately comprehended types who rely more for their identification on dialect and vocal personality than on gradual development or growth through action. Since characterization is left largely up to the actor, plot is the most important element of any serial script.

Serials differ in their quality and approach, depending on the type of audience to which they are designed to appeal. Among the most popular and prevalent are those directed exclusively at housewives,—tear-jerking tales

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in which emotion is at a premium, and blatant sentimentality is both permitted and preferred. The leading character is almost invariably a woman, usually one skilled in that interesting sort of platitudinousness known as "homey philosophy". This heroine is manipulated through an interminable series of emotional crises; her function is to suffer, but always to triumph because, like Lancelot, her heart is pure. The general message conveyed by such serials is one which confirms the average woman in her belief that "feminine intuition" combines with middle-class morality to make, if not the good, at least the desirable life.

It is generally agreed that these serials are of a low order, but since they continue to sell merchandise, there is no reason to believe that they will be immediately improved or withdrawn from the air. To some extent they are slowly being replaced, but at present they constitute the dominant type.

Other serials, usually presented in the late afternoon hours, are intended for a juvenile audience. They are pure adventure stores, of the "dime-novel" sort. The leading character is either a remarkable adolescent or a modern Robin Hood, and the plots usually point up some obvious moral or manly virtue.

Finally, there are a number of serials which attempt maturity either in plot, or treatment of characters, or both. These are considerably less maudlin, and often use a humorous approach. Some even attempt consideration of serious (though non-controversial) domestic problems. Most of them make amusing capital out of typical incidents of daily life; although too unvaryingly optimistic, they frequently maintain rather high standards of excellence. Such serials are usually (although not always) intended for a mixed audience of men *and* women; their success indicates that more would be appreciated.

(2) The **straight drama**, generally a half-hour playlet written especially for broadcast, is usually presented at night. Light comedy, melodrama, mystery, etc., are the popular bases for straight drama plots, although historical themes and romantic biography are sometimes utilized. Some of the best radio-writing is done for this type of show, and production is often of a very high order. The category as a whole probably includes many of radio's most entertaining dramatic programs.

(3) The **adaptation** is a form of radio drama in which a stage-play, short-story, novel or movie is re-written for broadcast purposes. The adaptive method, although the oldest of radio techniques, is not calculated to produce programs of particular excellence.

Where, as with Shakespeare or Shaw, the original version consists largely in self-sufficient dialogue, the adaptation may turn out splendidly (aside from the fact that so much must be chopped and pruned away in the process). And it is certainly true that adaptations of famous plays and novels have great educational value.

Still, the average play or book contains elements which cannot be reproduced by broadcast; moreover, at best only a scant portion of the original lines may be retained. To re-write and condense a stage-play for air-presentation is a difficult task, demanding great care and technical sympathy if it is to be done properly. Such patient skill is infrequently applied to adaptations; hence, they often lack coherence, and almost always fail to do justice to the original. It is significant that such programs usually rely more for their appeal on "big name" stars and directors, or on recent popular titles, than on the actual quality of the individual adaptation.

(4) The **comic skit**, a short, humorous sketch usually presented as part of a variety (music and drama) program, is closely related to the burlesque or vaudeville "black-out". Polished dialogue, presented with sparkle and clarity by talented comedians, often combines with intelligent satire to place the comic skit among the better examples of dramatic art on the air.

(5) **Educational drama** includes all radio plays or sketches whose intention is to instruct or propagandize. Featuring enactments of historic events, biographical material, or dramatic exemplification of ideas and modes of conduct, such programs have demonstrated their ability to perform many effective pedagogic functions. Some of radio's best writers and producers have probably done their most significant work in this field. The **aural newsreel**, in which contemporary events are "reported" in dramatic form, is an exciting member of the "educational" class which has done much to further the development of radio technique.

(6) Finally, there are the so-called **experimental productions.** These are self-conscious attempts to exploit the possibilities of aural presentation, and to create new art forms suited to the medium. Some excellent programs have resulted from these efforts to

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

lend the pretensions of "art" to what is at present an industry; but in general it may be said that most experimental radio plays are failures, when judged by the aesthetic criteria to which they appeal. They usually turn out to be rather badly written melodramatic fantasies, often of the psychological or "super-science" variety.

Partly responsible for this failure is the fact that writers of such programs have been too much concerned with achieving "effects", and too little with producing plays with "total" dramatic significance. A new narratorial technique, a new sound pattern; these have been sought, rather than good playwrighting. Radio drama may be said, in its more ambitious moods, to be still in its adolescence.

Of *radio drama in general,* it may be noted that beyond comedy or rare educational works, the results do not equal the means. Serious themes are seldom undertaken; the maudlin, the melodramatic or the fantastic remain the characteristic types. The production techniques are ready to accommodate significant work, but radio writers have not yet supplied the script. The reasons for this may be discovered, perhaps, in several facts.

Radio is very young, and so are most of the men who write for it.

Moreover, radio is subject to the most tyrannical censorship known to the arts (not excluding the movies). Since a wide variety of homes contain radios, and since any child capable of motor reflexes may turn the switch which floods his nursery with broadcast sound, it is argued that radio drama may not properly deal with subjects which might offend *any* listener. Considering the enormous number of subjects which might (and do) offend a portion of radio's 100,000,000 auditors, the writer is restricted to a rather narrow range of materials. He can be entertaining, or he can be a propagandist for "respectable" opinions; beyond that, he is not expected to go. (Sometimes he may go further, but such instances are exceptional).

This censorship is closely connected with the fact that radio is a commercial medium. Radio's present function is to make profits for the owners of stations and networks. These profits come from advertising. The material produced cannot be of such a nature as to endanger profits from advertising. Listeners are to be attracted, entertained, and made receptive to selling messages. Anything which might be repugnant or uninteresting to a potential buyer is not likely to be produced. The level and content of radio drama is thus censored by stations and sponsors in terms of the low-average taste; occasional sops to the high-brows notwithstanding. To which it must be added that the function of most programs is to sell merchandise or services; not to be significant or serious.

Most radio programs are sold or produced in bulk. With some notable exceptions, the writer does not simply turn out one program; he turns out a series. A tremendous quantity of material must be produced to meet inflexible deadlines. The average serial writer, for example, must create an average of 60 or more pages per week; the equivalent of 14 full-length plays per year.

The writer has neither the time to polish, nor the peace to invent. In consequence, he falls back on formula-fiction; grinds out his weary stint, and is not surprised to discover that his work is not comparable (from the qualitative point of view) even to that printed in "pulp" magazines, or produced in the most tenuous Hollywood "quickie".

Moreover, since radio shows are usually aired only once, and then forgotten, there is no incentive comparable to that of the literary man who may hope to leave his printed mark on posterity. Radio is ephemeral; the writer must be content with but a single performance.

Writing under pressure, frequently interested in his medium only because of the profits it holds out; restricted by censorship and required only to fill time in a manner which will entice people to sit through the commercial announcements, the radio writer has neither the opportunity, the motive, nor frequently the ability to do much better than he does.

Despite this, programs are regularly produced which have high entertainment value; and radio drama has achieved remarkably fine results on many occasions. Although the general standard is low, the individual program is sometimes excellent. Potentially, radio drama holds great promise; its quality is gradually improving, and the future may find it taking its place among the mature and serious arts. It remains to be seen whether television will outmode the familiar form of radio broadcast before such maturity can be achieved. See *Radio Writing,* Eric Barnouw, 1942; *Radio Writing,* Max Wylie, 1939. —J.F.M.

**radio drama, transcribed.** It is sometimes necessary to broadcast the same program over various stations at different times. In such instances, the show may be transcribed, i.e., recorded on an 18-inch record at 33-1/3 revolutions per minute, so that it may be "played back" whenever convenient. Auditions of radio programs are usually transcribed, so that they may be criticized at the sponsor's leisure. —J.F.M.

**radiograph.** X-ray "photographs". They are more correctly called shadowgraphs. A camera is not used to produce the radiograph. —H.M.

**rafter.** A timber or beam giving form, slope, and support, as to a roof.

**raga.** See ORIENTAL MUSIC.

**rag rug.** Woven or hand-looms. Pieces of cotton, linen or woolen cloth cut into narrow strips and woven. —B.E.J.

**ragtime.** See jazz; AMERICAN NEGRO MUSIC.

**rain-drop stroke.** In Chinese painting, the technique of shading developed by the Southern School of the T'ang dynasty, i.e., shading by small, pointed, oval strokes.

**raised plan.** See PERSPECTIVE.

**Rajput painting.** See INDIAN ART.

**rakkan** (Jap.). Signature on a painting. A painter's sign and seal.

**Raku yaki** (Jap.). A ceramic ware made by various potters in different places.

**Rakutozan yaki** (Jap.). Pottery made in Yamashiro province.

**ramada.** Wall-less wood, withe and palm shed used in place of nave before open chapels for Indians in Franciscan monasteries of 16th and 17th cents. in Yukatán. —J.M.

**ramma** (Jap.). Perforated decorative wooden panels placed above the inner walls of a Japanese interior to insure circulation of air.

**rampant.** See HERALDRY.

**random or uncoursed.** Term applied to masonry in which stone is laid without continuous horizontal joints.

**random coursed.** Term applied to masonry in which the heights of the courses are in no regularly recurring arrangement. (Note distinction between random coursed masonry and random masonry.) —J.M.M.

**range, in dance.** See movement.

**ranz des vaches.** A simple melody played on the Alpine horn.

**rapid seeing.** See PHOTOGRAPHY.

**rapid-transit.** See CIVIC PLANNING.

**rate of pitch.** See vibrato.

**raten** (Jap.). See raden.

**rationalism.** Synonymous with functionalism; modern; international style; progressive. An approach to architectural or industrial design unrelated to traditional styles, and chiefly a 20th-cent. manifestation; called a style of reason due to (1) cooperation of the artist with the engineering principles involved, with the dictates of machinery and with primary respect for function; (2) an appeal to the intellect by means of inherent relations, lines and proportions, rather than to the emotions by romantic associational aspects; (3) intelligent use of plastics and new materials; (4) a new "classicism" by virtue of emphasis on structural simplicity; (5) the affectation of mathematical systems of lines and spaces (cf. Paul T. Frankl, *Form and Re-Form*); (6) the logical awareness of new social demands, as mass-housing with problems of finance, sanitation, etc.; (7) realization of the need for horizontalism in line and form not only as functional "streamlining" in an era of speed, but as an observation of the psychological demand for repose. See POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U. S. A.; also MUSICAL PERFORMANCE, MAIN TRENDS IN. —A.W.M.

**rattle.** See MUSICAL INSTRUMENTS.

**rauschpfeife.** See MUSICAL INSTRUMENTS.

**raw sienna.** See iron pigments.

**raw umber, dark.** See iron pigments.

**rayonism.** A style of abstract painting founded by Michael Larinov in Russia in 1911, and characterized by radiating rays of light. See RUSSIAN ARTS. —L.L.D.

**ray pattern.** In Greek art, esp. on pottery of the 8th to 6th cent. B.C., a row of upward

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

or outward pointing rays, contiguous at the bottom or regularly spaced. —L.T.S.

**Rayy ware.** See PERSIAN ART.

**"ready-made" objects.** See object.

**realgar.** The name of this painter's pigment comes from the Arabic, *Rahj al ghār,* and the use of it appears to have been largely in the eastern Mediterranean and the Far East. It has been identified on wall paintings from sites in Central Asia and is mentioned frequently in ancient and medieval treatises. Chemically, it is closely associated with the pigment, orpiment, being also a sulphide of arsenic. Its color, however, is orange-red. —G.L.S.

**realism.** The depiction of the real or actual, in the sense of that which is immediately present to the senses or to the experience of men in the life of their own time and place. (1) In art, and from a formal point of view, realism differs from naturalism (q.v.) in stressing the "Universal in the Particular" while naturalism merely presents the "Particular" as the foundation of reality. While such a distinction is often difficult to make in practice, Rembrandt, Velasquez, Millet, Daumier, Brueghel, Egyptian sculpture of the Old Kingdom, Roman portrait sculpture (often), and Gothic sculpture of the fifteenth century are ordinarily termed realistic, while Hellenistic sculpture of the type of the *Barberini Satyr* or the *Torso Belvedere* in the Vatican, and the 19th cent. art of the type of Rodin's *Age of Bronze,* the sculpture of Hildebrand, and Meissonier's "photographic" painting are instances of formal naturalism.

(2) From the point of view of content, realism differs from naturalism in that it does not necessarily involve a naturalistic philosophy of life. In literature, naturalism is sometimes spoken of as an extreme form of realism. For instance, Hardy, Ibsen, and Flaubert are called realists; Zola and de Maupassant naturalists. In both art and literature realism appears more frequently, since it allows more varied opportunities for significant expression. It is likely to be a higher grade of art than naturalism, since it tends to be more complex and charged with human values, probing for some inner hidden truths or structures, and allowing the possibility of a teleological order.

(3) Realism is often used in both art and literature merely with reference to subject matter, an inaccurate connotation, since it may then be applied to art of many diverse styles, and is very likely to be confused with expressionism, unless the emphasis on design and on personal conception which characterizes expressionism (q.v.) is clearly understood.

Realism differs from idealism (q.v.) in stressing the actual as opposed to ideal ("Universal"), often insisting upon what the layman would call "ugly" subjects as opposed to "beautiful", e.g., The *Sheik-el-Beled,* German painting and sculpture of the 15th and 16th cents., Rembrandt's nudes, Velasquez's dwarfs, Donatello's *John the Baptists* and *Mary Magdalen,* Rodin's *Burghers of Calais* and *Old Courtesan,* Millet's *Man with the Hoe.* Realism differs from romanticism (q.v.) in its insistence upon fact as opposed to imagination, upon actuality as contrasted with plausibility and desirability, upon the present rather than the distant in time and place.

The philosophic meaning of the term realism has no application in art criticism. —L.D.L.

**realism, in photography.** See PHOTOGRAPHY.

**realistic Manifesto.** See SCULPTURE.

**rebacking.** See RESTORATION OF PAINTINGS.

**rebeck.** Primitive violin shaped like a half-pear; it had 3 strings. See MUSICAL INSTRUMENTS.

**rebinding.** The great bulk of hand binding practiced in the U. S. A. today consists primarily of rebinding damaged books. Our cheaper edition bindings too often have a short life in the lending library and must be rebound for further useful service. The larger libraries usually have their own facilities and smaller ones send their damaged books to trade binderies.

The damage to a trade edition usually consists of a broken back, including broken sewing plus a partially torn and loosened cover. The first step in rebinding the book is to remove the cover and either cut or sand off enough of the back to remove the original sewing. The back edge is then glued and allowed to dry. New end sheets (the fly-leaf and sheet that is applied to the inside cover) are then prepared by folding a strong sheet of paper and reinforcing the fold of the sheet with muslin. A folded end sheet is applied with paste to the first and last sheet of the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

book. The glued book is broken up into sections approximating the original signatures and fed one at a time into a special sewing machine that oversews each signature to the previous one until the book is completely sewn together. This method produces an exceptionally strong book that is superior to the original, but results in a book that does not open easily due to the over-sewing of about one-fourth of an inch along the back of the book. The back of the book then receives a light layer of glue.

The next step is to trim the book just enough to straighten the edges, and in this operation some binders trim so deeply that the original margins are completely destroyed. This is particularly true of old books that have been rebound more than once and have, due to the carelessness of the binder, lost about all of their margins, and with them most of the beauty and value of the original volume. The book is then rounded and smashed either by hand or machine. The smashing spreads the outer edges of the book to conform with the additional thickness of the cover and permits a better join to the cover hinge. A second layer of glue is applied and a strip of cloth (muslin, flannel, or a stiff net called super) is applied to the back and allowed to project about an inch onto the sides. Head bands, if used, will be applied at this time. A stain or stipple treatment is then applied to the top or all three edges of the book and it is ready to be cased in (the application of the cover to the book).

Marbled edges and fly-leaves were frequently used until a few years ago. Marbling consists of floating several colors upon water and combing them into a suitable pattern, then laying the edge of the book or side of the sheet on the surface of the water to transfer the pattern. Specially-made colors work best; however, ordinary oil colors diluted with linseed oil and turpentine will transfer fairly successfully and produce interesting results.

The making of the case (cover) is a simple operation. Two boards made of non-warping pasteboard are cut to fit the book plus a small fraction of an inch over-hanging on the top, bottom, and outside edges. A piece of binding cloth is cut large enough to wrap around the book and allow an overhang of about three-fourths of an inch on all sides. Glue or paste is applied to the back side of the cloth by brush or machine and with the boards in place on the book the cloth is wrapped around the book, pressed down, and then removed carrying the boards in proper position. A center strip of stiff paper equal to the width of the back is placed between the boards to stiffen the cloth back. The corners of the cloth are cut on a diagonal, folded in, and the edges turned and smoothed down. The completed case is allowed to dry and is ready to receive the title, which is usually hot stamped with brass type on the back with metal foil. Type metal may be used for the stamping of a very few books if the temperature is kept low enough to avoid the softening of the metal.

The casing-in operation consists of wrapping the cover around the book, gluing or pasting the top of the end sheet, and pressing down the cover. This is then repeated on the back and the book is placed between boards in a press to dry for about a day. The boards have metal edges that force the cloth of the cover down between the back and the boards to form a groove to the hinge. See EARLY BOOKBINDING AND FINE BINDING. —H.E.S.

**receding colors.** See COLOR.

**reciprocal pattern.** A design in which the motive is repeated, but, alternately reversed top for bottom.

**recital.** A concert at which a single performer executes the entire program.

**recitative.** See opera; oratorio.

**recorder.** See MUSICAL INSTRUMENTS.

**recto.** *Book.* The page of an open book on the right-hand side. The opposite page is the **verso.**

**red.** See SYMBOLISM IN FAR EASTERN ART.

**red bird.** See SYMBOLISM IN FAR EASTERN ART.

**red chalk.** Red ochre, ruddle.

**red-figured vases.** About 525 B.C., Athenian vase-painters invented a technique far superior to the previous black-figured type (see black-figured vases). After the vase was shaped, they incised their designs with a blunt tool, painted around the incision a narrow glazed line, then painted in the details, probably with a single-bristled brush, and finally filled the entire background with black glaze. As a result the figures appeared as terra-cotta red against a black background. The advan-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tage over the previous technique was that this allowed them much more freedom and variety in drawing than the earlier silhouette permitted. The great period of red-figured vases was from 525 to 400 B.C., in Athens. During these years hundreds of potters and painters flourished, supplying the great demand for Athenian pottery at home and for the export trade of the city. The range of their work was enormous. But certain broad periods may be distinguished, roughly dividing the 5th cent. into three parts. From 525 to 470 the paintings were distinguished by nervous, crisp, linear treatment, a fine rhythmic sense, spirited compositions, and experimentation in three-dimensional portrayal of the human body in action by the use of foreshortening and hatching. Among the leading painters were Euphronios, Euthymides, Macron, and, perhaps the greatest of all, Brygos. By the middle of the century the élan of the earlier time had generally been supplanted by a more monumental technique; the number of figures was lessened, the emphasis was on power and the amplification of forms. Polygnotus and the Penthesilea Painter are representative of this tendency. Toward the end of the century there was a vogue for the florid, ornate, and over-refined, with a consequent deterioration in linear precision and masterly design. Meidias, Aison and Aristophanes are typical of this trend. With the fall of the Athenian Empire at the close of the century the center of vase production shifted to Italiot Greece, where, during the fourth century, red-figured vases were made in Apulia, Lucania and Campania. These vases exaggerated the florid and over-refined tendencies of the final Athenian period, vulgarizing the shapes, crowding figures into chaotic compositions on various levels, profusely using polychromatic effects, and picturing melodramatic and comic scenes for popular appeal. —W.R.A.

**red lead.** Like the white pigment made from metallic lead, this has been manufactured since ancient times. Writers like Pliny seem to confuse it with other bright orange-red pigments such as cinnabar, but analysis has discovered it on many ancient objects. Probably the wide spread of artificial vermilion in the later Middle Ages had something to do with the decline in the use of red lead by artist painters. It is still a common article of commerce and is much used, particularly over metal where mixed with oil it serves as a firm undercoating for whatever color is desired. Chemically, it is a tetroxide of lead. Its color is moderately stable but has been found to darken and turn brownish with long exposure, particularly in the presence of some light and of high moisture. —G.L.S.

**reducing temperature.** *Cer.* To limit use of air in burning fuel so that excess gases will rob oxygen from oxides in body or glaze. See CERAMICS I.

**reed instruments.** See MUSICAL INSTRUMENTS.

**reed organ.** See MUSICAL INSTRUMENTS.

**refectory.** See FURNITURE.

**reflectance.** See COLOR.

**refinement.** *Arch.* Any variation from precision or exactness of line for the purpose of increasing the beauty of a building or making it more dynamic.

**reflections.** See PERSPECTIVE.

**refraction.** See PERSPECTIVE.

**refraction colors.** The colors of the spectrum as obtained by a refractive prism.

**refractive index.** The expression of the ratio of the velocity of flight traveling in a vacuum to its velocity in another transparent medium and is an index of the amount which the light rays will be bent when obliquely entering the transparent medium. —V.K.B.

**refractory.** *Cer.* Clay capable of resisting action of heat. See CERAMICS I.

**regal.** See MUSICAL INSTRUMENTS.

**regardant.** See HERALDRY.

**regence style.** See FURNITURE.

**regeneration of varnishes.** See RESTORATION OF PAINTINGS.

**regionalism.** The self-conscious and programmatic cultivation of a style and subject matter considered natural to the people and representative of the environment of a restricted geographic area, e.g., a state or province, to which the artist himself belongs by birth or early training. Regionalism is founded upon the following argument: (1) that an artist or author normally knows best the environment in which he was born and spent his early childhood, rather than anything he may have experienced later or elsewhere, (2) that a work of art is successful in proportion as

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

it depicts what the artist or author knows best rather than in proportion as it embodies timeless and/or international aesthetic values, which are empty abstractions (relativism), and (3) that therefore, most of the artistic quality of the work will derive from faithfulness to the appearance of the environment and to the habits and mentality of the people of the region, rather than from aesthetic merit *per se*.

In theory, regionalism would necessitate above all a stylistic unity among the artists of the region in question. Moreover, the style must be consciously cultivated and programmatically represented as native or natural to the region. It is then spoken of as either regionalistic or regional. As used in the United States today the two terms are synonymous. Neither term could be used to describe the art of Florence or Siena in the Renaissance, where the stylistic unity is unconscious and inevitable.

Historically, a mild regionalism occurred in Spanish novel writing of the second half of the 19th cent., which was consciously provincial, and which included such authors as Caballero, Valdés, Valera, Alarcón, Bazan, Pereda, and early Ibáñez.

The term ordinarily refers, however, to a minor American movement, primarily in painting, but to a lesser degree in literature as well, which achieved public attention in newspapers and popular magazines during the 1930's, flourishing essentially in the Middle West between 1933 and 1937. It was a subsidiary phase of the main movement in art and literature in the U. S. A. during the 1930's, known as the **"American Scene"**. This movement was largely a product of the depression and the efforts of the government to solve the economic problems of the artist through W. P. A. and P. W. A. projects which could be carried on wherever he was then living, and which would be considered useful by the public at large. The results of the "American Scene" movement were (1) to reintroduce into the arts a larger interest in subject matter as such and American subject matter in particular, (2) to encourage a realistic or romantic depiction of this subject matter, (3) to give artists and authors a greater confidence in the power of America to produce an important art independent of European influence, (4) to create an enormous public interest in art, and (5) to multiply the number of inferior but successful artists.

Within this general trend the regionalists, both by definition and historically, represented a special and narrower doctrine. The following are the chief characteristics of modern American regionalism not necessarily involved in the basic definition, but comprehended in the term as it is used in the U. S. A. today:

(1) Style was not stressed and no stylistic unity was achieved in any one state or geographic area, since, contrary to the expectations of the partisans, national and international forces, represented by such mechanisms as education, the radio, newspapers, magazines, cinema, and automobile, militated powerfully against regionalistic isolation. Moreover, each regionalist had drawn upon different European sources to form his style, so that they had nothing in common except the doctrine. Finally, they produced no converts or imitators of importance to carry on and propagate their several styles.

(2) Emphasis was placed almost entirely upon subject matter and the general attitude of the artist toward it; and the representatives of the doctrine even frowned upon the use of the word "style" as "arty".

(3) Ideationally, regionalism was the artistic counterpart and expression in America of the forces of conservative reaction in politics and culture which characterized the decade of the 1930's throughout the world, and of which the German version is the most clear and comprehensive. The regionalists themselves were in most cases unconscious rather than conscious fascists, i.e., cultural, but not necessarily political fascists. This is apparent in the following complex of characteristics of American regionalism: (a) It was anti-international. In particular it was anti-French. In the same sense as contemporary German art, American regionalism was "tribal", contending that blood relationship takes precedence over the international cultural forces of a given era in influencing art, and that an artist owes first allegiance to his local culture and national and racial heritage, and should reject the products and influence of contemporary, but foreign aesthetic principles and artistic styles. Regionalists stressed that an artist must "return from Bohemia" to the scenes of his childhood, renounce all foreign ways, cut off long hair and put on overalls. Like Nazi artists they painted self-conscious illustrations of the types of people in the several provinces of the country. (b) Regionalism was escapist, isolationist, and Americanist. Like isolationism in the politics

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of the 1930's, it was an effort to escape today's cultural issues. The method employed was a flight to the farm, and a Victorian revivalism, flavored by a mildly humorous popular-romanticism, and by a nostalgic admiration of the good old horse and buggy days. The chief subjects (usually presented with catchy titles) were farm scenes glorifying happy, healthy peasants—haying, plowing, praying, eating, washing, or fighting the elements—; farm animals, barns, and backhouses; old Victorian houses and bric-a-brac; Currier and Ives subjects; river steamboats; pioneers portrayed with historic accuracy to detail; early Americana; Daughters of the Revolution; and popular illustrations of the stories of Paul Bunyan, Paul Revere, Frankie and Johnnie, Tom Sawyer, and George Washington. (c) Regionalism was anti-intellectual and anti-aesthetic. The artists opposed or attacked museums as storehouses of old cultures managed by snobs, aesthetes, and decadents. They opposed the study of aesthetics and of the history and criticism of art as the activity of effete impractical intellectuals. They opposed liberal education as dull, noncreative, and confusing. They opposed art whose whole purpose is to please the eye or elevate the mind as "art for art's sake", and hence foreign, un-American, and likely to be "Bohemian" and immoral. Regionalism was, instead, ideological, and aimed to persuade the public to its general philosophy through the choice and treatment of the subject. It sought favor primarily with the masses rather than the specialists, i.e., serious artists, critics, amateurs, and art historians. It sought attention in the public press, glorified the man of simple tastes and little formal education, and appealed to the authority of common sense as contrasted with specialized education. This point is well illustrated by an oft-repeated public statement of one of the regionalists that the only good ideas he ever had came while he was milking a cow, and by the fact that the same individual conspicuously wore overalls when painting and teaching.

The chief regionalists in painting were Thomas Benton, John S. Curry, and Grant Wood, of whom the first two are still painting; and the chief trumpeter of the movement in popular books and in manifestoes to the press was Thomas Craven. A few literary men who wrote of the local scene in the 1930's subscribed to certain aspects of the regionalistic doctrine, but of these the abler writers can not properly be called regionalists any more than the great majority of "American Scene" painters, and none designates himself by this label. Robert Frost, for instance, who might be suspected, has elaborately denied the connection, and writers like Caldwell, Steinbeck, and Farrell, though they use material from restricted areas of the country, are clearly no more regionalists than was Thomas Hardy.

—L.D.L.

**regional planning.** See CIVIC PLANNING.

**register.** (1) A set of organ pipes of the same tone quality; generally called a "stop". (2) A distinct division of the tone quality of a voice—chest r., head r., etc.—or instrument.

**register, register mark.** *Etch.* Little dents in multi-color acquatint plates, used as a guide to insure that the various colored impressions match in the final proof. —K.K.

**regnum.** See tiara, papal.

**Reichenau school.** See Ottonian art.

**Reims, school of.** See Carolingian art.

**reisner work.** Wooden inlaid work of different colors.

**relation.** *Mus.* The degree of affinity between the keys, chords or tones of a scale.

**release.** In vocal music, the manner in which the musical tone ends in pitch, intensity, and timbre. It has many of the characteristics of the attack of a tone but a gliding release except in portamento is decidedly unpleasant. The extent and rate of a most acceptable attack would be musically intolerable for the release. The term release is usually applied to pitch, but there is every reason for extending it to intensity and timbre. —C.E.S.

**relief.** Art (originally an adaptation of It. *rilievo,* from It. *rilevare,* to lift up, to raise; subsequent adoption of Fr. *relief*).

1. *Architecture, sculpture, and allied arts*: (a) The projection or elevation of a design from a plane or curved surface, without complete detachment, in order to give an appearance of greater solidity or depth; also the degree of the projection and the part which projects. (b) The design or composition executed in relief.

2. *Painting, drawing, etc.*: (a) The effect of solidity, depth, or detachment given to a design on a plane or curved surface by the lines, shading, or colors of which the design

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is composed. (b) In a figurative sense, the vividness and sharpness of outline obtained by contrast or technical rendering, such as a figure in bold *relief* against the sky. (c) Certain processes in printing and photography.

3. *Cartography*: (a) (Attributed use) The effect of elevations and depressions of land surfaces obtained on maps by suitable coloring. (b) Relative effect of such conformations produced at suitable scale on maps or models.

4. *Physical geography*: The elevations and depressions of land surfaces.

5. *Military fortifications*: The difference in level between the top of a parapet and the bottom of trench or ditch.

*The term* relief *has two major meanings both derived from the same Latin root, one through the French* relever, *to lift up, to comfort; the other through the Italian* rilevare, *to lift or raise up. The first and most widely employed has come to mean the removal of pain or want, succor, release from duties by substitution, etc. The second meaning deals with measurement of the distances that one surface is raised above another or appears to be raised. It is in this sense that the term* relief *is used in art and accounts for the inclusion of subjects under* 3, 4, *and* 5.

Relief in the sense of the plastic arts, whether it refers to the design itself or to the distance the design projects, presupposes a solid background or surface from which the ornament rises. Relief then is essentially ornament which has projection or gives the illusion of projection (painting), and which is applied to a more basic form or surface. This form or surface may vary greatly in nature; it even may be sculpture itself; witness the designs in relief on the armor of Erasmo di Narni (Gattamelata) as represented in Donatello's equestrian statue. This admits also to the classification of relief, works in repoussé, cameo, embossing, chasing, and intaglio (qq.v.). It is evident, however, that the more monumental aspects of relief are seen as architectural sculpture applied as decoration to buildings and monuments.

Relief falls into two general classes or types: high relief, It. *alto-rilievo*; and low relief, It. *basso-rilievo*, Fr. *bas-relief*. Formerly the third classification of middle or half relief, It. *mezzo-rilievo* was used but has been merged by modern custom with low relief. The breadth of these terms not only causes confusion but makes accurate description difficult. Moreover, the type of relief is determined by the relative projection and not by the actual projection; for example, a silver jewel box may be decorated by figures in high relief though their total projection is no more than an inch, while the Parthenon frieze, whose projection is four times as great, is low relief; but in all cases some natural attachment to the surface from which the relief rises is essential.

A design may be considered in **high relief** when the projection from its background is never less than one-half the relative thickness of the object in relief. Generally, high relief designates ornaments or figures almost wholly detached from their background. This is achieved by "undercutting", which in many cases limits the attachment to a few isolated points. Examples: Parthenon metopes, 5th cent. B.C., (British Museum, London); Retable of St. George by Jan Borreman, active ca. 1479-1522 (Musée du Cinquantenaire, Brussels); Basin of Poseidon Fountain by Carl Milles (Gothenburg, Sweden).

A special use of architectural sculpture related to relief is the practice of attaching by artificial means to the surface decorated figures or objects carved or cast "in the round". This practice gives the effect of high relief and while productive of designs of great merit is not relief but pseudo-relief. Examples are seen in the pediment figures from the Parthenon, Athens, and from the Medici tombs by Michangelo in the New Sacristy, San Lorenzo, Florence.

**Low relief** may be considered to be any design whose projection from its background is not more than one-half the relative thickness of the object placed in relief, and in some cases this projection may be so slight that the surface of the relief and the surface of its background almost will coincide. Low relief as we understand it was called **anaglypta** by Pliny, but he also included in this term embossing and chasing. Examples: "The Wounded Lioness" from *The Lion Hunt of Assurnasipal*, Assyrian, 8th cent. B.C. (British Museum, London); "Nymphs" by Jean Goujon, Fountain of the Innocents (Place des Innocents, Paris).

Low relief of special nature is seen in **incised** or **sunk relief**; that is, the carved or modelled surface is sunk below the surface of the ground decorated. The design, therefore, is outlined by a sharply incised groove or channel, and within this limit of figures or ornament the surface modelling takes place, but only to the degree permitted by the depth of the incised outline, no portion of the design projecting beyond the normal surface of the ground decorated. This method was used

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

greatly but not exclusively by the Egyptians in monumental wall treatments as it lent itself both to the hardness of granite and the brilliance of light. (See relief sculpture; negative carving.) Examples: *Seti I in Battle,* Temple of Amon, Karnak; *Ramses III Overcoming his Enemies,* Temple of Ramses III, Karnak.

In architecture, three dimensional surface treatments to produce effects of greater strength or solidity are forms of low relief, such as quoins, chains and other forms of rustication. (See rusticate).

Relief, as the term is used in sculpture and architecture (see relief sculpture) in its more nearly original sense, is always associated with the decoration of a panel or frieze whose essential flatness is always impressed upon the mind of the spectator. Among the peoples of ancient Egypt, the Near East, and Pre-Columbian America this essential flatness was attained by keeping the relief of all forms in a design virtually constant. Spatial depth was indicated (a) by skillful modelling which allowed one form to be placed in front of another, as in line drawing, the relief of all forms being the same; or (b) by the convention of placing near forms at the bottom and more distant forms at the top of the panel. Examples: Details from the Mastaba of Akhuthotep (Louvre, Paris); "Naval Expedition," panel from Khorsabad (Louvre, Paris). As early as the 5th cent. B.C. in Greece and Rome the desire to create the illusion of spatial depth led to the rendering of several planes, one behind the other. This necessitated the use of several degrees of relief projection in the same design, often including both high and low relief. This practice led inevitably to a disregard for the inherent flatness and solidity of the panel. This same phenomenon may be observed in mural painting. (See mural painting.) Examples: Panels from the Altar of Peace, late 1st cent. B.C., Rome; "Triumph of Titus," Arch of Titus, Rome.

It must be remembered, however, that the use of high and low relief in the same design will not in itself destroy the inherent flatness of a panel, but only when the relief projection is used in an effort to create the illusion of atmospheric depth. In fact, the use of high and low relief combined in one design is observable in all periods and divisions of art. In Byzantine and Romanesque art as well as in the pre-classic, oriental, and pre-Columbian American cultures its use was for decorative or illustrative purposes rather than for rendering the illusion of spatial depth. Examples: Egyptian Funerary Stele, New Kingdom (Louvre, Paris); Bronze Doors, 10th-11th cent. A.D., Cathedral, Hildesheim, Germany; Maitreya Buddha, Western Caves, Yün Kang, Shansi, China). However, in Gothic and subsequent periods the rendering of one plane behind another in order to heighten the realistic effect of the scene became the accepted practice, continuing to be seen in numerous examples of contemporary work.

A phase and development of the illusionary idea is seen in the introduction of pictorial backgrounds in low relief. The resultant design is known as **pictorial relief.** This seems to have been an invention of classic times due to realistic predilections, as it is noted as early as the 1st half of the 2nd cent. B.C. in the smaller frieze of the Pergamon Altar, but reached its fullest classic development under the Roman Empire. In the Renaissance, with the added knowledge of linear perspective, pictorial relief reached its maximum development and use. Example: 2nd set of gilded bronze doors for the Baptistery at Florence, by Lorenzo Ghiberti, 15th cent. The idea of pictorial illusion is carried still further in architecture when the relief composed of architectural forms becomes part of the basic design of the structure in order to give the illusion of increased dimension. Example: Apse in relief, San Satiro, Milan, by Bramante.

Modern methods and materials have given rise to additional uses and forms of decorative relief. Panels of monumental size are now possible in moulded glass and synthetic plastic materials. Modern theory tends to abandon the use of relief to create illusion of spatial depth and to confine its use once again to its decorative and illustrative functions, at the same time expressive of the function of the surface decorated and the nature of the material used. See *Oxford Universal English Dictionary,* c. 1937; Chase and Post, *History of Sculpture,* 1924; Charles R. Morey, *Medieval Art,* 1942: *Encyclopedie Photographique de l'Art,* Musee de Louvre, Edition "TEL", 1935; Meyric R. Rogers, *Carl Milles,* 1940; A. M. Rindge, *Sculpture,* 1929.

**relief sculpture.** Is one of the oldest forms of art and was used in every cultural epoch. It originated in pre-historic caves, emanating from drawing. Relief has been carved in stone, wood, ivory; hammered into metal sheets and cast into various metals; cast in plaster, cement, metals, ceramics and plastics. It has been used on every type of building created by man for the living and the dead as well as on his places of worship, on decoration of his home, on useful or decorative articles, perhaps more than any other form of art.

The term "relief" designates the projection, in various degree, of one or several sculptural figures, animals or objects, from a surface. It derives from the Latin *rilievo* (projecting), but is also used when the sculptural design is on the same level as the surrounding surface or set back of this surface. Incised (intaglio) and hollow (concave) reliefs are not true relief forms according to established rules; however, they are generally classified as reliefs.

The primary rule of relief, high or low, is the uniform expression on a frontal plane (as many high points must be arranged in a plane so that they will give the impression of a plane). In order to achieve depth there must be a rear surface parallel to the frontal plane which is the background from which the figures are silhouetted. It follows that, if a composition is arranged along a frontal and a rear plane, all parts of the composition must conform to this rule. It is therefore wrong to flatten the bodies (as in low relief) and round out the heads (as in high relief) or allow any extremities to rise forward beyond the frontal plane. In low relief, all parts must be in relation to each other, viz., low; and in high relief, all parts must be relatively high.

Prime considerations in relief are light and shade, materials, and the distance from which it may be seen. It is most important to study the proposed location of a relief for light conditions, the distance from which it may be observed and the probable effect of light and distance on the desired material, before execution of the design. A stone relief may be more compact, emphasizing the form, whereas a bronze relief allows looser construction but demands a clear silhouette. The visibility of a relief may be increased by treating foreground and background differently: a stone relief treated smoothly on the figures may have a rough background or the latter may be colored contrastingly; on a bronze relief the foreground may be gilded or patined in contrast to the background. Ceramic reliefs are generally polychromed for better visibility and effect.

**High relief (grand relief, alto-rilievo),** as the name indicates, is well set off from the background and the figures may be almost or entirely in the round. It is generally used on the exterior of buildings and monuments or churches, usually at considerable distance from the spectator. We find in the Greek pediments of Aegina or the Parthenon that sculpture entirely in the round was used, yet since the figures were arranged along a frontal plane against a background, they form a true relief.

**Medium relief (half or demi relief, demi or mezzo-rilievo)** varies in projection between high and low relief. As the term is not definite, it is rarely used. A medium to high relief is usually called high relief and a medium to low one, bas-relief or low relief.

**Low relief (bas-relief, basso-rilievo)** is the common type of relief, and may create an impression of roundedness and depth, even when quite low. As it has little projection, it offers fewer difficulties in technical execution or reproduction than higher relief. This type of relief is used on low exterior and interior architecture, interior decoration, wall and other placques, on medals and coins, jewelry. As the emphasis on form decreases in low relief, line, and esp. silhouette and perspective, are of great importance. Extremely low relief may be little more than a plastic drawing.

**Incised relief (intaglio)** is not a true relief, inasmuch as it consists only of a frontal plane without background. It consists of incised outlines and rounded out forms cut into a flat surface. The impression of depth and roundness is created by light and shade on the rounded forms, by overlapping and foreshortening.

**Intaglio** (in contrast to *rilievo*: projecting) was used extensively by the Egyptians; it made its reappearance in the 20th cent. and is used largely in the decoration of architectural surfaces which do not allow projections.

**Hollow relief (inverted, concave relief, cavo-rilievo)** is not a true relief, having no background, but may be used as the mold for a true relief. Hollow relief creates the impression of roundness by optical illusion since its sculptural forms are not convex or plastic, but concave, hollow. As the light touches an inverted relief, light and shade are reversed. When highlighted from above, shadows form

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

on the upper parts of the relief and light appears below, in contrast to a projecting relief, which would be lighted on top and shaded below. It is unusual to encounter the hollow relief; some examples may be seen on the walls of British and French buildings, Rockefeller Center, New York. The Greeks and Romans used it mainly on gems for sealing rings; the Babylonians carved it into stone cylinders which were then rolled over clay and left a plastic imprint. It is now used mainly in negative carving (q.v.) for bas-relief, and in modern abstract and semi-abstract relief sculpture, sometimes in connection with convex forms, also in sculptural cut glass. —C.L.S.

**religion and art.** *Kinships.* (1) The closest kinship between religion and art is their common endeavor to reshape the world better to satisfy man's vision and desire. Each demands a more abundant and harmonious life for man, and adds wonder and meaning to the commonplace. Both presuppose an orderly world amenable to their purposes. Both approach life with zest and enthusiasm; are adventurous and creative; require a self-forgetful devotion and concentrated striving; face the risks of failure; and result in deeper insight into reality. (2) The kinship of religion and art is emphatically proved by their inseparable blend in primitive ritual and festival; here are united at once the seeds of the fine arts and the roots of religion. (3) There is also kinship of effects. Aesthetic enjoyment and religious adoration are psychologically similar. Both spring from emotion, live in exuberant imagination, and awaken admiration, reverence, and awe. Both demand free meditation and absorbed attention, and may issue in a feeling of harmony attained, increased vitality, and a liberated and expanding self. Each experience has a kind of immediacy, self-sufficiency, and intrinsic good which one would gladly prolong; and at the heights: ineffable rapture, with a sense of finality amid an incomparable calm.

*Differences.* (1) The greatest difference between art and religion is that the aesthetic object is a particular thing present to the senses, whereas the religious object is the idea of a spiritual being of cosmic range. The aesthetic response is impersonal contemplation; the religious, a personal communion. (2) Religion issues in moral demands upon daily living, whereas aesthetic enjoyment remains detached from moral and practical concerns. Religion concerns one's destiny; art is an immediate and present satisfaction. Art seeks an imaginative transformation of life; religion, an actual one. (3) Art moves in a restricted sphere of semblance, whereas religion is an orientation of man's whole self to total reality. (4) The widespread antagonism between religion and art springs basically from the religionist's fear that the sensuous art creation will monopolize attention, become an idol, and obscure the Invisible Infinite; while the artist, if he is religious, encounters fearful difficulties in representing spiritual conceptions and the Infinite in particular sensuous materials.

*Interactions.* The interactions of art and religion are age-long and profound. (1) "Religion is the mother of the arts" (Hocking). The principal subject-matter and the most powerful inspiration in the history of the arts has been religion. Religious contemplation of nature has produced manifold artistic creations, notably transcendental poetry. (2) The arts serve religion in endless ways. Since art enhances and joyifies human values, it is inevitable that religion should forever call upon the arts to make its values vivid, impressive, attractive, enjoyable, and immortal. To list the arts which have served religion constructively would be to name them all. (3) The religionist who has discovered the secrets of beauty knows that he needs the fine arts for perfecting his worship of the Perfect One. The artist who has discovered the secrets of religion finds himself animated by the most powerful drive to artistic creation. So long as art and religion endure they will stand in profound need of each other. See Percy Dearmer (ed.), *The Necessity of Art,* 1924; G. Arnaud D'Angel, *L'Art Religieux Moderne,* 1936; Jane E. Harrison, *Ancient Art and Ritual,* 1913; Von Ogden Vogt, *Art and Religion,* 1921. —R.F.P.

**relining.** The process of backing a painter's old and weakened canvas with a strong and fresh one is called relining or sometimes lining. In this treatment the original canvas is not removed from the structure but is merely given further support by the new one attached. Until the latter part of the 19th cent. some mixture of glue or glue and paste was the common adhesive for this attachment, but since that time there has been a growing tendency to fasten the canvas together with a wax or a combination of wax and resin. See RESTORATION OF PAINTINGS. —G.L.S.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**reliquary.** Any precious and mobile object expressly designed or merely used permanently to enshrine and thereby to honor the material remains of a person provided that the spirit of that person be regarded as immortal and as the worthy object of a religious cult. Material remains in this definition are either any parts of the person's body or objects hallowed by contact with him (her). Although not absent from other religions reliquaries are proper to Christianity, since from early times no Christian altar could be consecrated unless it contain, support or be built upon the relics of a Saint.

Outstanding forms of reliquaries are: (1) **pocket reliquaries,** imitations in precious material of the bags, in which relics were carried in the times of the geographical expansion of Christianity; (2) **shrines** or **chasses,** which in accordance with an age-old mortuary tradition usually were conceived as houses of the dead and took the forms of dwellings or churches; (3) arm, head and finger reliquaries shaped to represent the outer contour of those members of the body of which they enshrine the skeleton. In addition any capsule, box or casket can be used as a reliquary as well as any cross, cover of a sacred book, statue or statuary group. See ostensorium; depositorium; encolpion. —R.B.

**relish.** An obsolete ornament of the family of shakes, used esp. in the old harpsichord music.

**remarque.** See PRINTS AND PRINT PROCESSES.

**Renaissance** (rebirth). This term is applied to the reawakening of the arts, of learning and living in Italy in the spirit of the classical past of Greece and Rome. The conception of a renewal of the arts was expressed first by Ghiberti (1378-1455), in his *Comentarii* (2d book) in which he discusses the works of the leading painters and sculptors at the end of the 13th and the beginning of the 14th cent. The architect L. B. Alberti (1404-1472), in the dedication to Brunelleschi in his *Three books on Painting* (1455), conceives the rise of a new era in Florence with Ghiberti, Brunelleschi (1377-1446), Donatello (1386-1466), Masaccio (1401-1428) and Luca della Robbia (1399-1482), in the first part of the 15th cent., thus continuing the ancestral line of Ghiberti into his own age. Finally, Giorgio Vasari (1511-1574) in the introduction of his *Life of the Painters* (1st ed. 1550) uses for the first time the actual term *"rinascità"* (Renaissance). The idea of the "revival" has also drawn elements from the religious conception of the return of a new era after a thousand year aevum (K. Burdach). The French term *"Renaissance"* has been chosen as a subtitle by Michelet for the 7th volume of his *Histoire de France* (1855), and has been made universal by Jacob Burckhardt's book *The Civilization of the Renaissance* (1860). In contrast to Burckhardt, there have been varied efforts to pre-date the period of the Renaissance to the time of the flourishing of Italian art in the High Medieval period, most notably that by Henry Thode in his *Franz von Assisi* (1885). Thode wants to stress the Christian elements in the Italian Renaissance and consequently sees in St. Francis of Assisi (1181-1226), Dante (1265-1321), Giotto (1266-1337) and Petrarch (1304-1374) the founders of the Renaissance movement. We have learned from the opponents of Burckhardt an understanding for the continuity of tradition in Italian art from the 13th cent. to the era of the classical revival in the early 15th cent. Essential contributions to our knowledge of the Renaissance have been made by Jacob Burckhardt, Arthur Symonds, Walter Pater, Heinrich von Geymüller, Adolfo Venturi, Wilhelm Bode, Bernard Berenson, Heinrich Woelfflin, Aby Warburg, Erwin Panofsky, J. Huizinga and many others.

We speak of an early Renaissance, 1420-1500, of a High Renaissance, 1500-1520 or 1530, and a late Renaissance or Mannerism, 1530-1600. This period is characterized by its effort to rationalize and systematize the steadily increasing amount of empirically gained observations and to apply them in the fine arts. The scattered observations about *perspective,* which the 14th cent. with its growing naturalism had made, were welded into a scientific system by Alberti, Piero della Francesca (about 1420-1492) and Pacioli (c. 1445-1509) and applied since the days of Masaccio (most important the "Holy Trinity", S. Maria Novella, Florence, 1427). The study of *anatomy* became based on analysis and since the end of the 15th cent. On dissecting and was translated into exact human *proportions* in the sculptures of Donatello, Ghiberti and others. The study of proportions, supported by the revival of Vitruvius' book on architecture (MS. rediscovered 1455 by Poggio in St. Gallen), was carried forward by Brunelleschi and Alberti. The inborn Mediterranean tendency for harmony, symmetry and anthropocentric thinking grew

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

strongly and opposed medieval transcendentalism. Yet the Christian tradition remained dominant. It found a closer kinship with Plato's idealism than with Aristotle's realism.

The rebirth of the classical spirit is, in the beginning, based less on the actual knowledge of antique art than on divination, on scattered observations of the few known examples, esp. sarcophagi and triumphal arches and an occasional reference to classical literature. Antique mythology is handed out to the artists by the humanists since the days of Petrarch (therefore "Humanism"). Not until the end of the 15th cent. was a large group of antique sculpture (*Hercules Farnese, Laocoon, Apollo Belvedere, Marsyas, Venus Medici, Three Graces, Torso Belvedere,* etc.) unearthed, collected (the most important collections those of the Medici in Florence, the Gonzaga in Mantua, and the Popes in Rome), and its motifs introduced into sculpture. Roman architecture was studied by Brunelleschi and Alberti, sketched by Jacopo Bellini (c. 1400-1470) and introduced into painting by Mantegna (1431-1506) and his contemporaries.

*Architecture.* Gothic churches in Italy, in their façades as well as in their interiors (as we may see exemplified in the cathedrals of Siena, and Orvieto), have never conceded to the verticalism of the Northern Gothic but have maintained an even balance between the horizontal and the vertical tendencies that is traditional with Mediterranean architecture. The architects of the Renaissance had only to replace the ornamental system of the Gothic with that of the Antique but could maintain the basilica scheme and the spatial conceptions of a tradition which was to some degree continuous since Roman days. Brunelleschi was the first to force upon the traditional basilica scheme of the Gothic cathedral of Florence (1296-1462), the classical dominant of a cupola. Although in its design still using elements of Gothic construction (outside ribs), it clears the way for one of the main motives of Renaissance and baroque architecture, the fusion of the longitudinal nave and the centralizing cupola into one organic structure of half antique and half medieval derivation. Michelangelo (1475-1564), in his designs for St. Peter's (since 1547) and its cupola (finished 1590), has carried this tendency to its first climax, preparing the ingenious solutions of the baroque. The second important contribution of Brunelleschi was the harmonious decoration of classically proportioned interiors with antique columns, architraves and pediments as we see it first in small buildings in Florence such as the Pazzi Chapel (1429-43) and the old Sacristy of S. Lorenzo (1420-29) followed by the basilicas of S. Lorenzo (1421—after 1461) and St. Spirito (1436-1476). Leon Battista Alberti, introduced a more powerful, partially antique-Roman version of the new style into other parts of Italy (Rimini, S. Francesco [1446-1455]; Mantova, S. Andrea [1472-1494, side nave, choir and cupola later]). As the most ideal solution of a perfectly harmonized interior and exterior appears to the Renaissance architect the centralized building of the Pantheon type. Yet the liturgical demands of the Christian Church have successfully opposed these aesthetical conceptions. Instead of a centralized new St. Peter's as conceived in the drawings by Bramante (c. 1444-1514) and Michelangelo, only Bramante's small model church of S. Pietro in Montorio (Rome, 1499-1502) carried out the conception of the architect. Other centralized churches of exemplaric beauty are Santa Maria della Consolazione in Todi (1508-1524) and Santa Maria Carceri in Prato (1485-1491). Hospitals and monasteries humanized their exteriors in adding hospitable loggias and colonnaded courts (Florence Foundling Hospital, 1420-1451, by Brunelleschi. It is with Bramante, Michelangelo and the brothers San Gallo, that richer and more dramatic effects became introduced (Medici Chapel, Florence [1520-1524]: Choir of St. Peter's, Rome [1546-1604]), which prepared the transformation toward the baroque.

The architecture of secular buildings such as palaces, villas, and city halls found a genuine Mediterranean expression with the reintroduction of the classical column orders and of antique decorative motives. The defense character of the medieval house gave way to the comfortable and representative edifice. Harmonious and convenient groundplans, regularity and symmetry of façades, clarity of proportions, open loggias and galleries, large gardens and impressive vistas bespeak the house as the artistic shelter of the cultured owner. From the Palazzo Medici-Riccardi (1444-1452) by Michelozzo in Florence to Antonio San Gallo's (1483-1546) and Michelangelo's Palazzo Farnese in Rome (1534-1580), a continuous development of the new façade and groundplan type can be observed. With the publication of Vitruvius' books on architecture by Fra Giocondo in 1511 the tendency toward greater monumentality and ornateness found support in a closer imitation of classical examples. Rusticated stones and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

engaged columns dramatized the façades. Bramante's Belvedere (1486-1492), Peruzzi (1481-1536), Raffael's Villa Farnesina (1509-1511) in Rome, the Library of San Marco in Venice (since 1536) by Sansovino (1486-1570), the architecture of Vignola (1507-1573) and Palladio (1518-1580) in Northern Italy bespeak the style of secular architecture in the High and Late Renaissance.

*Sculpture.* The Renaissance worship of the human body as the noblest feature of creation gave sculpture a new meaning and importance. The large sculptural programs for churches in the sense of Gothic cathedral iconography came to an end with Donatello's (1386-1466) statues for the cathedral (1408-1415) and the Campanile of Florence (1416-1426) and Ghiberti's bronze doors for the Baptistry of Florence (1403-1452) and with both artists statues for Or' San Michele (since 1412). After 1450, secular and semi-secular subject matter created an art for the collector or patron, while devotional art continued for the altar shrine, the baptismal fountain or the pulpit. Monumental assignments for public squares, court yards and gardens fostered the appearance of new types of equestrian monuments (*Gattamelata,* by Donatello, in Padua, 1446-1453; and *Colleoni,* by Verrocchio [1436-1488], in Venice, 1481-1493); statues (*Judith* by Donatello, c. 1455, and *David,* c. 1430 or 1450; *David* by Verrocchio, c. 1465, and *David* by Michelangelo, 1501-1504); and fountains (Verrocchio's *Boy with Dolphin,* Florence, Palazzo Vecchio, c. 1480). The art of bronze casting became regenerated by Ghiberti and Donatello. Donatello's *David* was the first life-size bronze statue since the days of antiquity. It was also revolutionary in its full nudity, something exceptional within the Christian tradition. Themes from pagan mythology stimulated the representation of human flesh and human passion (Pollaiuolo, 1429-1498). The late A. Warburg has opened our eyes for the return of these Antique *"Pathosformeln"* (basic motives of passion), in sculpture and painting. In Michelangelo's figures for the Medici Chapel, in Florence (c. 1523-1533), the Christian and pagan currents, still harmoniously combined in his David, came to a dramatic and profoundly tragic encounter. For more popular use and in simpler interpretation, the technique of terra cotta cast (della Robbia's), helps to spread the forms of the Renaissance.

*Painting.* Similar characteristics apply for painting. Works of medium and small size, created by individually appreciated masters, made paintings objects for collectors or for religious-aesthetical worship at home besides the continued use in churches. Portraits and mythological subject matters worked towards a partial secularization of the Renaissance civilization. Fresco painting continued to be a favorite with the Italian painter. Besides the Florentine masters such as Masaccio, Uccello (c. 1396/9-1475), Castagno (1423-1457), Fra Angelico (1387-1455), Fra Filippo Lippi (c. 1406-1469) and his son Filippino Lippi (c. 1457-1504), Ghirlandaio (1449-1494), Pollaiuolo, and Verrocchio, the greatest masters outside of Florence are Piero della Francesca, Giovanni Bellini (1430-1516), and Mantegna. Elements of antique architecture and sculpture form a learned framework for the Neo-Classical spirit in composition. However, the interference of the Gothic "International" style and the Christian background in the native tradition can be continuously felt as a counteracting element. The examples of Botticelli's later mystic style, the influence of northern prints, the subject matter of the pieta (q.v.), imported through German wood sculpture, the introduction of the new Flemish technique of oil painting, may suffice. As far as form and composition are concerned, the main problems of the Renaissance artist were: the conquest of three dimensional space (Masaccio); the achievement of plasticity by means of light and atmosphere (Masaccio); the symmetrical or harmonized composition of anatomically well built and well proportioned human figures and a mood of controlled humanity in aesthetically beautiful bodies and configurations (Botticelli, 1444 or 1445-1510, and Signorelli, 1441-1523). Expressive tendencies and realism are subordinated under the ideal of harmony.

All these endeavors, handed on and improved throughout the 15th cent., reached their culmination in the masters of the High Renaissance: Leonardo (1452-1519), Giorgione (1478-1510) and Titian (1476/-1576), but foremost in Raffael (1483-1520) and in Michelangelo. The complete application of the laws of perspective, anatomy and proportion, the Aristotelian unity of time and space in perfectly harmonized and deeply animated compositions seems achieved in Raffael's School of Athens (1510), in the *Veneration of the Holy Sacrament* (c. 1510), and in Michelangelo's Sistine Ceiling (1508-1512). However, it must be realized that the so-called High Renaissance did not last longer than from 1500 to 1530 and was quickly su-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

perseded by Mannerism and pre-baroque tendencies.

The Late Renaissance enhanced the chiaroscuro style for greater emotional effects as we discern in the later work of Titian, in Tintoretto (1518-1594) and in Correggio (1489-1534). It combined this quality with a dramatization of movement, following the all-influential example of Michelangelo's *Last Judgment* (1535-1541) and the rhetorical style of Raffael's latest works. Art tended in Florence toward Mannerism, [Rosso (1494-1541), Primaticcio (1504-1574), Pontormo (1494-1557), Bronzino (1502-1572)], in varying and paraphrasing the style created by the masters of the High Renaissance.

While Florence under the Medici was the center of the early Renaissance, Rome became the center of action under the warrior Pope Julius II (1503-1513) and the epicurean Leo X (1513-1521); Venice, Ferrara, Mantova, Verona and Milan created highly productive local types of their own. But mostly, Florentine artists were those who disseminated the germs of the new movement to smaller communities and to foreign countries. The rest of Europe accepted the forms and doctrines of the Renaissance rather from these late children of a great age, then from the style of the Early and High Renaissance.

At the beginning of the 16th cent., the northern late medieval realism and naturalism had developed to a point where it was ripe for an understanding of the doctrines and forms of the Italian Renaissance.

FRENCH RENAISSANCE: the elements of the Italian Renaissance came to France under Francois I (1515-1547) and found its application in the construction of richly decorated castles with medieval groundplan but Renaissance decoration (Blois, finished 1519; Chambord, since 1526; Fontainebleau, since 1528). The south and west wings of the old Louvre received since 1546 their Renaissance shape through Pierre Lescot (1510-1578). With Philibert De l'Orme (c. 1515-1570) France saw a master in whom theoretical knowledge and classical application came to its climax. Since 1564 he built for Catharina Medici the Tuilleries castle (destroyed 1871). In church architecture we find a continuation of the Gothic church interior cloaked into a mantle of Renaissance forms. St. Etienne du Mont (since 1517) and St. Eustache (since 1532) in Paris represent the new type. Here the foundations for the Classicism of French art, inborn as it was, were laid. Goujon (1510-1568) and Pilon (1535-1590), expressed the new ideals in sculpture, while a host of Florentine artists such as Rosso, Primaticcio and others, including the aging Leonardo, brought classical form and content to France. Jean Clouet (c. 1485-1540) and his son Francois (1510-1572) paralleled the work of the German Renaissance painter Hans Holbein (1497-1543), in a porcelain smooth and minature-like art of portraiture. In general, French Renaissance as well as German Renaissance only slowly yielded to classical proportions and Mediterranean structure but willingly lent itself to an adaptation of the ornamental system of the Renaissance amalgamating it with the Gothic tradition.

ENGLISH RENAISSANCE: The German painter Hans Holbein brought the message of the Renaissance to the English court. It remained prevailingly an affair of the court circle, stimulated by the occasional visit of Italian sculptors and painters. Throughout the 16th cent. architecture and decorative arts clung to the "perpendicular" late Gothic style, sometimes connected with Italian ornamentation introduced by Pietro Torrigiani (1472-1526) and Benedetto Rovezzano (1474-1552). Not before the 17th cent. did it find its proudest expression in the Palladian classicism of Inigo Jones (1573-1652) and Christopher Wren (1632-1723). Jones' free usage of Palladian motives appears in the Banquet Hall of Whitehall (since 1619) or in the staircase of Ashburnham House (1650/60). (Yet in Jones' work and more so in that of Wren we recognize many baroque elements so that it might be more appropriate to deal with it under the term baroque [q.v.].) Lord Burlington's (1695-1753) Palladian revival kept the architectural language of the late Renaissance alive in the 18th cent.

GERMAN RENAISSANCE: developed under the guidance of the systematical mind of Albrecht Dürer (1471-1528). He made the graphic arts the most powerful vehicle for the new conceptions in form and thought. His striving for perspective representation, anatomical precision and humanistic subject matter, based on methodical studies, widened the scope of Northern European art for centuries. Between 1500 and 1530, most of the German painters are seized by the Renaissance current. Hans Holbein, whose name we have met already, carries the specific forms of the German Renaissance to Switzerland and England. He is the foremost portraitist of the era, a great draftsman and illustrator. Mathias Gruenewald (c. 1470-1528) may rather be considered a late medieval artist while

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Lucas Cranach (1472-1553), Hans Burgkmir (1473-1531), and Albrecht Altdorfer (c. 1480-1538) show the direct influence of the Italian Renaissance, transmitted partially by Dürer himself. In sculpture and architecture, the peculiar blend of northern heaviness and love for intricate ornamental playfulness with Italian classicism becomes evident. Amongst the sculptors we notice Konrad Meit (c. 1480-1551), Peter Vischer, the Younger (1487-1528), Hans Vischer (1488-c. 1549) and Peter Floetner (c. 1490/5-1546), all of them with the exception of the first products of Nürnberg's humanism.

The "German Renaissance" in architecture, not without influence on the architecture of the neighboring countries to the Northwest and North, finds its most typical representation in secular buildings such as castles, city halls and patrician dwellings. Cities like Nürnberg, Münster, or Luebeck still furnish an idea of the German Renaissance town. Elias Holl's (1573-1646) city hall of Augsburg (1615-1620) is perhaps the greatest document of a typical German Palladianism.

Flemish and Dutch renaissance: In the Flemish countries Metsys (c. 1466-1530), Mabuse (real name Gossaert, 1478-1533/4), Van Orley (c. 1492-1542), Lucas van Leyden (1494-1533) and Scorel (1495-1562), headed the large number of **Romanists** (q.v.) who turned for artistic inspiration toward the South. International recognition as a portraitist fell to Antonis Mor (1519-1577) while Pieter Aertsen (1508-1575) started the long line of Dutch still-life painters. With Pieter Breughel the Elder (c. 1525-1569), the Flemish soil contributed one of the greatest interpreters of human life and of nature as a refreshing force to the aging and mannered Late Renaissance epoch.

In the field of architecture similar as in England the Gothic Style continued longer than in painting and sculpture. Painters were even instrumental in the introduction of Renaissance motives in architecture, often applied to smaller decorative units such as doors or paneled walls. Jacques Dubroencq (c. 1505-1584) must be considered the initiator of an Italianate style in Holland. In Cornelis Floris' (1514-1575) city hall of Antwerp (1561-1564) the ornate mannerism of the Late Renaissance appears in its most typical formulation. From it resulted the peculiar Flemish mannerism. Yet the spirit of the Renaissance has found its most genuine expression in the North in the growth of the sciences and to a certain extent in the religious spirit of Protestantism.

Spanish renaissance: As in all non-Italian regions the transformation into the Renaissance appeared first in smaller monuments and merely as a decorative system. The structural qualities of Spanish art remained first unimpeded. Italian artists were instrumental in the dissemination of Renaissance forms. The combination of Renaissance forms with Spanish-Moorish-Islamic ornamentation was known as the **Plateresque style** (q.v.), a term taken from silverwork. Due to its exuberant ornateness it foreshadowed the baroque. Amongst the most classical, and therefore rare, solutions we may mention the sacristy of the cathedral of Sevilla and the city hall of Sevilla (since 1527) by Diego de Riaño (✠1534) and his successor Martin De Gainza (c. 1500-1555/1556). With Juan de Herrera (1530-1597) the disciplining influence of Vignola and Palladio brought true Classicism to Spain as exemplified in the Escorial (1563-1586) in Madrid or in the Court of the Bank of Sevilla (1583-1598).

Spanish sculpture did not detach itself from the church in the period of the Renaissance except in the field of pure decoration. The Italian Pietro Torrigiani (1472-1526) whose name we also find connected with the introduction of Classical art in England brought the naturalistic terra cotta style of Northern Italy to Spain and thus was instrumental in the development of the extreme realism in Spanish sculpture. Alonzo Berruguete (1480-1561) transferred the language of Michelangelo and Sansovino to his native soil.

In the field of painting Charles V's (1519-1556) taste was eclectic and Italian artists invaded the country throughout the later 16th cent. The flourishing of a genuine Spanish school can hardly be observed within our period.

The Renaissance in Spain appears rather as an alien interact between the Moorish-Gothic and the baroque era. —A.N.

**Renaissance modes.** See idiom B.

**rendering, architectural.** See architectural rendering.

**renge** (Jap.). The lotus, very commonly used in Buddhist art as the symbol of purity.

**renge-dai** (Jap.). See lotus throne.

**repaints.** See RESTORATION OF PAINTINGS.

**repercussion.** *Mus.* (1) The constant repetition of a note or chord. (2) In a fugue the constant recurrence of the theme. (3) The most reiterated tone in Gregorian chant, the dominant of the mode.

**repose.** See balance.

**repoussage.** *Etch.* When a plate is repaired and scraping and rubbing with snakestone and charcoal, a hollow is left which would print a gray smudge. To prevent this, the plate is laid on a flat steel surface and the hollow is eliminated by gently tapping the plate on the back with the ball pen of the retroussage hammer. This is called retroussage. —K.K.

**repoussé** (Fr.). The technique of producing a design in relief by hammering the reverse side of a ductile material, such as silver, etc. A common metal technique in the Orient. See METALWORK. —J.A.M.

**representation, representative** (L. *repraesentatio*). A mode of *composition* (q.v.) in art, in which details are arranged in such a way as to suggest to the imagination some concrete object, person, scene, or group of them, in space. Some representation goes further, and suggests a series of events in time, in which such objects (things, persons, scenes) move, change, and affect each other. Representation can be mimetic (based on resemblance, as in pictures), or symbolic (based on words or other abitrary symbols, as in literature). Representation can be highly naturalistic or abstract, altered, distorted, stylized. It may co-exist with utility, decoration, and exposition as a factor in the total form of a work of art. —T.M.

**reprise.** See SONATA; SYMPHONY.

**Requiem Mass** (L. *Missa pro defunctis*). A solemn mass (q.v.) sung in commemoration of the dead. The Introit gives the Mass its name: *Requiem aeternam dona eis, Domine.* The divisions of the Requiem are similar to those outlined under *mass* except for the omission of the Gloria and Credo, and the substitution of the Tract for the Allelulia. The great sequence *Dies irae* follows the Tract. Save for the Kyrie, *Dies irae,* and *Libera* which though often included is not an integral part of the Requiem, all of the plainsong melodies date from the 7th cent. or

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

earlier. For plainsong melodies of the Requiem see *Liber Usualis* pp. 1807-15. —V.A.

**requiem oratorio.** See oratorio.

**reredos.** See altarpiece.

**reservation.** (1) A very large, naturalistically landscaped park; see CIVIC PLANNING. (2) The space occupied by a street railway when it is separated from other traffic by curbing. —T.I.C.

**resettlement.** See CIVIC PLANNING.

**residential estate.** See CIVIC PLANNING.

**resin.** Most of the varnishes used for surface coatings on works of art are made by dissolving a resin in a suitable solvent so that it can be brushed or sprayed. It is not a new practice. Egyptians of the 19th dynasty were familiar with it and it was used by the Incas of South America in their embalming practice. The general term is applied to any of a large number of hardened secretions or excretions of plants. Most resins are taken from the plant by tapping, the fluid at that stage being a balsam. Evaporation or artificial treatment removes volatile oils, leaving usually a hard, brittle, and slightly colored lump which has been dissolved by the varnish maker. It is general to classify resins for convenience as the oil-varnish resins, largely copals and spirit varnish resins, including dammar, mastic, and sandarac. The former group is made in oil, the resin being fused with the oil rather than dissolved in a solvent. —G.L.S.

**resins, acrylic.** Among the so-called plastics or synthetic resins, these are well known and one commercial form is produced as a molding compound under the name, *Lucite.* These have been used more in industry than in the fine arts, but recently have been employed to a limited extent as a film material like varnish. As a molding material, the *polymerized methyl methacrylate* is probably the most useful of the group. It is a hard, strong substance, somewhat thermoplastic, and works well mechanically. Its distinguishing feature among the various kinds of synthetic resins is its lack of color and its extreme clarity. Print can be read through many inches of it. —G.L.S.

**resolution.** *Mus.* The reduction of the degree of tension of an interval by moving one or both of its constituent tones in such a way that an interval of lesser tension is the result. In a broader sense, any procedure aiming at a reduction of tension within a group of elements (particularly chords) closely following each other. Apart from, sometimes instead of, reduction of interval tension, voice leading, metrical and dynamic arrangements etc. are effective devices of resolution. —E.K.

**resonator.** See ACOUSTICS; MUSICAL INSTRUMENTS.

**respond.** See MEDIEVAL MUSIC.

**responsorial psalmody.** See psalmody.

**responsorium.** See MEDIEVAL MUSIC.

RESTORATION OF PAINTINGS. The aim of restoration as it is practiced today by reputable restorers is to preserve works of art by detecting and correcting their causes of deterioration and returning them as nearly as possible to their original state. This simple and logical end has not always been sought by restorers. Indeed more paintings have been permanently injured or destroyed by inexpert or over-zealous restorers than have been lost by years of neglect. Straightforward, intelligent restoration dates roughly from the turn of the century. Earlier literature on the subject is of little value to the student or professional. Much of it is vague, describes doubtful methods long since considered obsolete. It is only in recent years with the establishment here and abroad of technical schools and well-equipped museum laboratories that the profession of restoration has been regularized and practiced for the good of the works of art. The present discussion will attempt to deal with the subject in the light of recent generally accepted practice. It must be borne in mind that many of the answers to problems are still lacking and that there is much room for study and improvement. This advance will undoubtedly come in the wake of technical publication and wider consideration among those working in the field.

*Panel paintings* because of their age, their construction, and the many destructive agents to which they have been subjected, present serious problems in restoration. As a rule Italian pictures on wooden supports will have suffered to a greater degree than Flemish or other northern works of equal age. Northern artists, esp. those of the Flemish school, se-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

lected and constructed panels more carefully than did the Italian painters. Thin, clear oak panels, prepared with a minimum of *gesso* or oil ground, was the accepted practice in the north as opposed to the Italian method of using thick panels of soft woods prepared with heavier *gesso* grounds. This difference in technique accounts for the tendency of Italian panels to warp more readily than Flemish panels, thus weakening the bond between *gesso* ground and wooden support with resulting loss or damage of paint film. Extremes of moisture or absence of moisture due to overheating are the most frequent causes of such damage plus the destructive action of wood beetles in undermining the structure of the panel itself.

**The cradles**, much in vogue in the last century and still widely employed, is considered by many to be a harmful procedure. It has been observed that uncradled panels have survived in better state than those so harnessed. **Cradling** consists of applying a grillwork of wooden slats to the rear of a panel to hold it straight while allowing it freedom of movement with changes in its moisture content. This movement in wooden panels is always across the grain, the length remaining unaffected. In the early form of cradling (***parquetage a ptat***) notched slats were glued to the panel at regular intervals, the grain of the slats running with the grain of the panel. Into these stationary members, sliding slats resting on the panel were fitted. Theoretically, this method was designed to keep the panel in a simple plane and prevent buckling along the face of the painting. In practice, however, the fixed members, made of new wood, at times covered up to 75 per cent of the original panel subjecting it to new stresses. In time, too, the sliding members became locked or frozen with the result that new cracks appeared along the shearing edges of some fixed members. The face of the panel also tended to assume an undulating character similar to a washboard. To overcome these obvious objections an improved method was introduced ***parquetage de champ,*** in which thin stationary strips were used, placed edgewise, one narrow edge being glued. This beam-like construction covered less panel area at no sacrifice of strength. Panels so treated twenty-five years ago have given less trouble although no way has been found to assure free movement of cross slats at all times. Because of the physical properties of wood, it is improbable that a perfect harness of this type can be devised. Both of the foregoing systems have other more serious faults. To successfully cradle a picture, it must be planed down to a thickness of ¼ in. to ⅛ in. While this facilitates straightening, it exposes a new section of wood which readily reacts to moisture and one original dimension of the picture is destroyed. In many cases the thickness of a panel furnishes important clues to the scholar in reconstructing altar-pieces or other works, parts of which have become scattered in various places. The complete character of a work of art should always be preserved.

*Transposition.* Wood beetles are another cause of deterioration within the fabric of wooden supports. The tunnellings of these insects are so extensive at times that panels, especially those of soft woods, are reduced to a dusty sponge-like structure of the most fragile nature. *Gesso* ground and paint film resting on such uncertain supports are in extreme danger. The traditional treatment in such cases was that of transposing or transferring them to a new panel or to a canvas support. This operation, requiring the greatest skill, consisted of protecting the paint film with paper and canvas and by working from the rear, of removing the wooden support down to the *gesso* ground. The *gesso* and paint film were then attached to a new panel and this cradled, or the whole was mounted on a stretched canvas. Neither of these systems is recommended. They both destroy the remnants of the panel and with the second method, the canvas weave in time becomes visible on the paint film transforming its character by destroying the crackle or competing with it. The most satisfactory method of treating excessively weakened panels is to bind the fibres together with some pliable water-proof agent. This has been successfully accomplished by the **impregnation method**, a technique which offers the only logical solution to date. This is accomplished by thoroughly protecting the paint film and floating it in a thermostatically controlled tank containing a mixture of beeswax and resin. Time of immersion will depend on the kind of wood, its thickness and condition. Panels so treated have regained up to 75 per cent of their weight and most of their original strength as supports. Furthermore, the wax, flowing through the interstices of the wood fibre, reaches the *gesso* ground and paint film furnishing a new bond with the support. The advantages of the above treatment are obvious. Wax is one of our most permanent materials and it has great adhesive power.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Fibres bound with it are protected against moisture and consequent expansion. Furthermore the original dimensions and character of the support remain unchanged. Where a panel is still structurally sound the back may be treated with liquid resins applied at room temperature or with the aid of infra-red lamps, and given additional support by attaching slotted aluminum channels of small section. These are secured by means of small aluminum screws placed in the slots and penetrating into the panel the distance of three or four threads. For small panels, a U shaped section is applied over the ends of the panels. These may be slotted and attached with screws or held in place with wax.

Most cradled pictures still thick enough to be treated with wax and metal supports benefit if their cradles are removed. Excessively thin panels, however, must be given some auxiliary support. This is best done by the use of sheet aluminum or plywood of waterproof construction. The panel is impregnated and then floated onto the support in a bed of wax. The adhesive power of wax will firmly hold the picture to the auxiliary support while permitting any slight lateral movement required.

The **cleaning of paintings** is another delicate problem of the restorer. In recent years the old notion that paintings must not be deprived of their old *patina* (q.v.) has been discarded. Protective films of varnish, especially oil varnishes deteriorate with age and become yellow. At times, because of excessive moisture, exposure to smoke, acid fumes or other agents, varnish films completely obscure an otherwise sound painting. It was also general practice during the 19th cent. to add warm brown pigments to varnishes to simulate the *patina* of age. Pictures in these states may be successfully cleaned and restored to much of their original brilliance. Two methods are generally employed, the friction method and that employing solvents. The first of these is the traditional one and is not to be recommended. It consists of rubbing with the fingers aided by an abrasive, usually powdered resin. The difficulty of controlling the degree of cleaning by this method is its chief fault. It is also very drastic where paint film has a very fine crackle, the edges of which are raised and subject to loss through abrasion. Solvents in the hands of experts furnish the safer method. Many solvents are available among which turpentine, acetone, diacetone, alcohol are the safest. The last two may be mixed with retarding agents and when so diluted their speed of action may be regulated. They are used with neutralizing agents such as turpentine. Alcohol is a very valuable agent but its use must be left strictly to the expert. It readily dissolves varnishes and gums but its action on glazes may be disastrous. In all cleaning, small unimportant sections should be cleaned first. This will serve the dual purpose of finding the key of the original colour and of determining the resistance of the varnish films. As a rule, **repaints**, covering old losses or modifications in design painted by others than the artist, will come away with the varnish as many of these will have been executed between varnish films. At times, however, old restorations or changes will require more drastic measures, involving stronger solvents or scraping. In all cleaning operations care should be exercised when working in dark areas. Black and brown pigments are easily damaged. In tempera paintings, the use of water must be avoided as this may disturb the water soluble ground and pigments. The use of soap and water as a cleaning agent is not recommended in any case.

**Regeneration of varnishes** rather than cleaning is sometimes desirable. This may be accomplished by exposing the painted surface to the fumes of ethyl alcohol over a specially designed tank. The fumes will coalesce the granular particles of resin in the varnish and restore some of its transparency. Similar results may be obtained by finely spraying with diacetone alcohol. Neither of these treatments should be taken as permanent cures and they both involve certain dangers. **Retouching** of losses is a necessary evil. It is best done with water colours as these remain stable with age while oil pigments tend to darken. Losses are stippled to harmonize with surrounding areas of old paint. These repairs should be visible with a glass and not painted to appear as original although care must be taken to match the neighboring colour as closely as possible and not cover it. Where large losses are encountered the best museum practice indicates the use of a neutral tone blending with nearby original paint but not reproducing its design or form. This is esp. desirable in early works but may be more difficult to achieve in the later realistic types of painting. It should be remembered that the original work is more important than that of the ablest restorer.

**Rebacking** or **relining** is the operation of placing a new canvas behind an old painting. It is not to be confused with transposing or transferring the pigment of a picture to a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

new canvas support. Rebacking is a required treatment for all torn paintings and pictures more than 50 years of age, the maximum life of the average canvas. Due to rotting linen fibre, the weight of ground and pigment and, at times, the destructive action of mold, canvases sag, lose their strength and usually shear along the edges of the stretcher. Once so released they tend to shrink causing buckling and loss of paint film. Rebacking may be applied to paintings on single canvas supports and to those previously rebacked. The procedure is much the same in both cases. The face of the canvas must be protected with paper applied with medium strength glue. It is then removed from its stretcher and placed, face down, on a board. The new canvas is stretched on a heavy relining *châssis* and shrunk by application of water. When the canvas is dry, the operation is repeated to achieve maximum tautness. The painting may now be attached with a paste or glue adhesive or by use of wax. The aim in both operations is to achieve a strong and flexible bond. Hygroscopic and brittle glues and pastes must be avoided as well as excess of wax if this is used. In each case the use of moderate heat is required to achieve the bond although some restorers favor using a press for this purpose. Where the *impasto* is thick, however, the press is not an advisable tool, as excessive pressure will break down raised pigment and force it into the canvas. Relining of older pictures, already rebacked, follows in the above order after the old relining has been removed. In these cases, the painting is placed face down on a board and its edges fastened to prevent shrinking. The old relining canvas is removed in small strips. In stubborn cases water may be used to help this operation but it is not allowed to remain longer than necessary. When the relining canvas has been removed, the back of the original support is thoroughly cleaned. Rebacking onto wood or plywood panels for aesthetic and practical reasons is not recommended. Aesthetically, a canvas mounted on a firm support loses its character and practically, one so mounted is difficult to remove should the support move or split. Both glue and wax methods of relining on canvas may be used although in very large paintings the weight of the wax may be considered a drawback. When the relining process has been completed, the picture is removed from the heavy *châssis* and placed on a stretcher. Its protecting paper is removed and it may then be cleaned as described earlier or varnished. In all cases the edges of relined pictures should not be trimmed but should be preserved in their original dimensions. The common practice of trimming and binding edges destroys evidence indicating whether a painting is in its original size or only a fragment of a larger work.

**Varnishing** or **resurfacing** a picture, is the final operation in restoration. The traditional varnishes used are **Mastic** and **Dammar** and they are still the safest protective films for this purpose. Recently synthetic resins have been employed. Advantages are claimed for these because they are water white and are stable. The conservative restorer, however, will doubtless care to learn more of their properties before using these materials exclusively. Good qualities of Mastic and Damar varnish can be purchased although each restorer has his preferred formula. They should be applied on a dry day in a dust free room maintaining a temperature of about 80 deg. F. The object in brushing varnish is to evenly spread as little as possible. It is applied in quick crisscross strokes and brushed until practically dry. Brushes and the paintings must be free from lint or other foreign substances. The excessive lustre of freshly varnished paintings may be eliminated by applying a thin coat of wax (for formula see *Technical Studies,* October 1934), and buffing with a soft brush. This also tends to reduce blooming.

*Technical aids and records.* The well equipped restorer's shop should own or have access to x-ray and ultra-violet ray apparatus for studying and recording the state of works before they are restored. He should have the services of a competent photographer to do the necessary technical photography required in recording all steps of any operation. In addition, written records should be assembled for future reference. The accumulation of radiographs, infra-red ray photographs and other prints will form a growing body of technical information of value in problems of restoration and study of style. The above requirements are especially important where public or museum property is concerned.

Many details of technique have been omitted because of space limitations and because many are personal choices with each restorer and achieve similar ends. The most important principle in all departments of restoration is to avoid drastic or final treatments which cannot be modified or changed if necessary. **rest stick.** See mahlstick.

**resurfacing.** See RESTORATION OF PAINTINGS.

**Resurrection.** Although central to the Christian faith the Resurrection was hardly ever represented in early Christian and East Christian art, as the canonic Gospels fail to describe it directly. Instead there is in 4th cent sarcophagi symbolic reference to it in form of the labarum (q.v.) placed triumphantly above a cross surrounded by the sleeping guardsmen form the Gospel account. Other forms of indirect reference are: (1) the Anastasis (usual in Byzantine art and in phases of Western art directly or indirectly dependent on it); (2) The holy women being shown the empty tomb by an angel (both in Eastern and Western art, in Italy until 14th cent.). (3) *Noli me tangere* (q.v.).

Direct representation of the Resurrection was prepared theologically in the apocryphal Gospels of St. Peter and by the Eastern church father Ephraim Syrus, who initiated the belief of all medieval writers in the miraculous Resurrection from the closed sepulchre. Western art, which after ca. 1000 A.D. undertook the direct representation of the Resurrection, usually neglected this theological specification and showed Christ standing in the open tomb (earliest German and Italian type) setting one foot on its rim (usual German and French type) or standing beside it (Flemish 15th cent.). Representation of the Resurrection through Christ rising above the sepulchre was initiated by Italian artists of the 14th cent. in imitation of pictures of the Ascension to heavens and spread in the 16th cent. to artists of all Europe. Sleeping or startled guards are a usual corollary of all types of direct representation. —R.B.

**retable.** See altarpiece.

**reticella.** See lace.

**reticulated.** When referring to Oriental pottery, the design is a perforated weblike form, superimposed over the main body of the vessel.

**retouching.** See RESTORATION OF PAINTINGS.

**retreating color.** See receding color.

**retrograde, retrograde form, retrograde inversion.** See imitation; TWELVE-TONE TECHNIQUE.

**retroussage.** *Etch.* A method of bringing the ink up from the incised lines of an intaglio plate in order to make certain passages darker and richer, by widening the lines. This is done by dragging a soft rag gently across the ink-filled lines before printing. See PRINTS AND PROCESSES. —K.K.

**reveal.** The surface at right angles to the face of a wall, at the side of an opening cut through it; known as a splay when cut diagonally. —J.M.M.

**reverberation.** See ACOUSTICS.

**reversible carpet.** See carpet structures.

**revetted architecture.** See ARCHITECTURE.

**revolving stage.** See MODERN STAGE-SETTING.

**Rhages ware.** Persian (Iranian) pottery from the city of Rhages. See PERSIAN ART.

**Rhenish architecture.** Within Romanesque architecture Rhenish churches are characterized by the clarity of their basilica plan ("square schematism"), their early monumental groin vaulting systems (Speyer cathedral, 1080 ff.; Mainz, cathedral, 1081 ff.), their picturesque silhouettes with tower groups at either end (Worms, cathedral, ca. 1180 ff.), often with tre-foil transepts (Cologne, St.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Mary in the Capitol, ca. 1065; Cologne, Holy Apostles, 1191 ff.), and by their rich decoration (Schwarzrheindorf, ca. 1151). See Frankl, *Die fruehmittelalterliche und romanische Baukunst,* 1926; Lasteyrie, *L'architecture réligieuse á l' époque romane,* 1912; Porter, *Medieval architecture,* 1909; Rave, *Romanische Baukunst am Rhein,* 1922. —R.K.

**Rhenish school.** The term refers to the style of works of art, primarily reliefs, of the 12th and early 13th cent. in the Cologne region. This style presents an interesting combination of French Gothic, German Romanesque and Carolingian Renaissance; its most outstanding example is the *Dreikönigsschrein* (ca. 1200, Nicolaus of Verdun, Cologne cathedral). The figures of the prophets and apostles which decorate the shrine containing the relics are not treated with the archaic cube-like simplicity of the German Romanesque, but they are clearly and plastically developed. The softly flowing folds of their robes lack the stylized treatment of the Gothic and the faces, instead of the conventionalized Gothic beauty, show strong individual expression which is carried over into the attitudes of the bodies.

Other examples of this style are the *Viktor Schrein* in Xanten, ca. 1129, by Master Eilbertus of Cologne; the *Heribert Schrein* of Deutz (near Cologne), ca. 1170-1180, by Godefroy de Claire (born in Huy near Dinant and also known as Gottfried of Huy). —H.H.

**rhinocerous cup.** Made from rhinocerous horn which was supposed to detect poison. Rhinocerous horn is a material often used for glyptic art in the Orient. —J.A.M.

**Rhodian ware.** See Ionian vases; ISLAMIC ART.

**rhombus** (Gr. *rhombos*). In Greek art, esp. pottery, an ornament of diamond shape, i.e., a four-sided figure with two opposite sides parallel and with two angles obtuse and two acute. —L.T.S.

**rhyparography.** The depiction of sordid, foul or mean objects. Also refers to the painting of genre or still life pictures.

**rhythm.** The word rhythm is derived from the Greek *rhein* which means "to flow". Rhythm means a continuance resulting from reiteration of the same or similar component parts.

*General.* The importance of rhythm is based on the value of alternative tension and relaxation like working and resting, waking and sleeping, etc. Rhythm suggests, therefore, the lawful periodicity of every phase of life, whatever it may be. Without rhythm life would be chaotic and one would not be able to look back over it as a whole. The recognition of periodically recurrent signs or marks gives man the feeling that this course is necessary by law and it gives him a certain relief, calmness, and pleasure. Every human being has his particular rhythm of life. Every work created by men must reveal this rhythm. In works of art rhythm plays an especially important role because it is the main instrument for organizing and unifying the different parts, and unity is one of the main requirements of art. The rhythmical element becomes especially evident in the applied arts. Here the rhythmical periodicity is the foremost means of aesthetic expression and is perceived by the spectator as such. In each so-called independent work of art, moreover, rhythmic repetition, sometimes very complicated, is present and can be perceived. Each artist, every people, and every epoch produces a characteristic kind of rhythm. Thus the recognition of rhythmical peculiarity aids in finding the time in which, and the author or school by which a work has been created. One may distinguish between rhythm of color, line, and form. In the continuity of the three originates the whole rhythm of a work. —A.J.S.

*Music.* Pattern of time values allotted to consecutive musical elements. Usually the term rhythm implies that a particular time pattern recurs systematically. If this is not the case, the rhythm is called irregular. In the tonal idiom the time patterns are related systematically to the basic accent patterns; therefore, in the province of this idiom, frequently no strict distinction is made between rhythm and meter (see idiom). —E.K.

*Dance.* Rhythm in movements of dance, apart from the rhythm of their emotional content, is the organization of the time and stress values into a united motor experience.

Rhythm is a constant principle of muscular action, which is action and rest, and is the only form in which muscular action takes place (see movement). It is the particular proportioning of the time and stress elements within these periods of action and rest that determines the specific rhythmic structure of a given movement. Rhythmic responses, therefore, are based upon the rhythmic experience we gain from sensations of active muscles, for it is the organization existing in these muscle sensations that furnish the uniting element for

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

consciousness (see kinesthetic sense). Through association, rhythmic stimulation has the power to stimulate emotional responses. It produces a fundamental and elemental response, primarily organic, secondarily intellectual and discriminating. Through the medium of these fundamental responses and their resulting stimuli of association, feeling states are aroused according to the richness of the imaginative and emotional natures. Thought and feeling also follow rhythmic pulsations. Every feeling state has its appropriate and peculiar motor concomitant. There are movements of joy, rage, sorrow, and so on through the list of feeling states, each with its own rhythmic structure. Therefore, expressive movements is of necessity rhythmical because of the influence of thought and feeling upon its form. The rhythms of song, poetry, music, and the cadences of speech are as much manifestations of organic rhythm as breathing, walking, or any other muscular action. All song forms that have grown up to stir mankind to mass action and concert the efforts of human physical power are based upon the rhythms of muscular action. They employ for their forms the measured accents, durations, and pauses of the tasks they are to stimulate and heighten. Thus rhythmic stimulation has the power to arouse emotional responses.

In its broadest meaning *rhythm* may be said to be the mold through which expressive life flows in creating its art forms. In this sense rhythm is the primary, fundamental art form. In dance, rhythm means much more than keeping time or the rhythm of skilled movements. Skilled movements as such are not art, i.e., not dance. They are unemotional. But when associated with and conditioned by the rhythms of thought and feeling, they become emotive and through the power of suggestion they call up the feeling state they are meant to portray. Technical movements that are intended to arouse feeling require the use of rhythm in its fullest meaning. Rhythm overflows into all the compartments of thinking, feeling, and acting, and produces an artistic rhythmic whole. *Rhythm of dance* is intellectual, emotional, and spiritual forces manifested in rhythmic movement.

The terms *"a rhythm"*, *"rhythms"*, and *"rhythmic pattern"* must not be confused with *rhythm*. Rhythm is the inclusive term which is the feature that all rhythms share. The other terms refer to a definite pattern embodying rhythm. —M.N.H'D.

**rhythmicists.** See POLISH ART.

**rhyton** (Gr. *rhyton* fr. *rhytos*, flowing). In Greek pottery, a drinking cup originally in the shape of a horn running to a point with a small hole for drinking, later in the shape of an animal or human head, open only at the top. —L.T.S

**ribat.** (Ar.). Military station for the Holy War against unbelievers (of the Mohammedan faith); a monastery. See ISLAMIC ART.

**ribbed vault.** A masonry vault in which solid ribs carry a lighter, relatively thin web or vaulted surface.

**ribbon and wreath.** See ex libris.

**ribbon development.** See CIVIC PLANNING.

**ribeba, ribeca, ribible.** See MUSICAL INSTRUMENTS s.v. rebeck.

**ricercare, ricercata.** *Mus.* Instrumental composition in free fugual form.

**richness.** Used in criticism to refer to the artistic material that is wrought upon the formal structure of the work. It is recognized that there are two extremes beyond which works of art can not go, and between which they vary: at one end, a bare formal organization, with no matter to give this texture and content; e.g., a simple plot. At the other end, a mass of matter that obscures the art form, and so becomes incoherent and meaningless. Works become "rich" as they approach this second extreme; i.e., as they exhibit a greater wealth of detailed treatment of artistic material serving to exploit and vary the bare form. —I.J.

**riddle canon.** See canon.

**ridge.** *Arch.* The upper angle of a roof; that part of a roof where the rafters meet the ridge-pole. See also drypoint (an intaglio process).

**ridge-pole.** A horizontal timber at the ridge of a roof, to which the rafters are nailed or attached.

**rigaudon.** The original name of the pre-classic dance form now known as the *rigaudon* is not recorded, but the origin of the dance has been traced to ancient Italy. Peasants of Provence knew the rigaudon at a later period. It received its present name when a 17th

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cent. dancing master, Rigaud, presented it to the French court, where it became very popular. In 4/4 or 2/4 meter and rhythmically similar to the *bourrée* and the *gavotte,* the rigaudon began on the last quarter-note of the measure, the beat being divided into two eighths in contrast to the single-note upbeat of the *bourrée.* The frivolous mood and brilliant steps of the dance found a permanent place in ballet vocabulary, and rigaudon music is sometimes found in the old instrumental suites. —J.G.

**right of eminent domain.** See CIVIC PLANNING.

**rikkwa style.** See FLOWER ARRANGEMENT.

**rinceau.** See acanthus scroll.

**ring.** See JEWELRY.

**riohitsu** (Jap.). Two side openings in a sword guard.

**ripieno.** *Mus.* A part or instrument which merely rounds out the harmony; opposite *solo* or *concertante.*

**riser.** The vertical part of a step.

**risposta.** Answer or response in a fugue (q.v.).

**ritornello.** *Mus.* Something returned to, or repeated. (1) A burden or refrain. (2) An introductory, connective, or concluding instrumental passage in a song.

**ritual costume.** See COSTUME ART.

**rivaq** (Ar.). Roofed arcade surrounding court of a mosque. See ISLAMIC ART.

**rivolgimento.** *Mus.* The inversion of parts such as in double counterpoint (q.v.).

**ro** (Jap.). A square fire-box fitted in the floor as an appurtenance of *cha-no-yu* (q.v.).

**Robineau porcelains.** See CERAMICS II.

**rocaille.** See rococo.

**rocker.** See PRINTS AND PRINT PROCESSES; mezzotint.

**Rockingham ware.** See CERAMICS II.

**rockwork.** *Arch.* Stonework with a broken and rough surface.

**rococo.** (From *rocaille,* shell shape, a favorite motive in late Baroque ornamentation, composed of shells and stones. Term used first between 1830/40. It signifies the latest phase of the Baroque from ca. 1720 to ca. 1770/80 and is applied to all manifestations of the fine arts, although the term indicates that it originated in the decorative arts.)

As a reflection of the growing sophistication of the French court under Louis XV (1715-1774) and the increasing influence of woman's taste in its circle, the pompous and heavy forms of the Baroque take a turn now toward the light and the elegant. Undulating S-designed forms become more slender and impress their shape upon every organic and inorganic being. Composite creations, half shell, half branch, express the playful vitality of the period in a wealth of ornamental inventions. It is indeed basically an ornamental style comparable in its abundance of designed motives only with the Late Gothic and indicating in this similarity that we are dealing with a late phase in the history of styles in which static-classical composure dissolves into a dynamic and yet refined ornamental language of forms. And indeed, the Rococo is the last *genuine* art style of Europe in which architecture, sculpture, painting and the decorative arts partake of the same expression. The feminine element appears in the predilection for richly decorated silks and brocades, instead of velvets characteristic of the Baroque proper and in the choice of a lighter color scheme of silken blues, pinks and white which replace the dark colors (contrasted with light) of the 17th century. Introduction of new techniques such as the porcelain (by Boettcher 1708/9) and the pastelle (Rosalba Carriera since 1720) can be taken as an expression of the growing sophistication and daintiness of taste. The unusual, the eccentric, the irregular are chosen in order to counteract the "ennui" of a more and more formalized and rationalized civilization.

The motives peculiar to the Rococo originated in the ornamental designs of grotesques by Berain (1640-1711). Gilles Marie Oppenordt (1672-1742), Juste-Aurèle Meissonier (1695-1750) and Claude Gillot (1673-1722) excel in the new ingenious designs for the decorative arts which become exemplary for the rest of Europe. In *architecture,* the temperamental and plastical Baroque style of Filippo Juvara (1685-1736), and his predecessors Guarino Guarini (1624-1685) and Francesco Borromini (1599-1667) becomes translated into the different national idioms

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and blended with the new French system of decoration. The new rooms at Versailles decorated by J. J. Gabriel (1667-1742) and the Hotel Soubise by G. Boffrand (1667-1754) bespeak increasingly of the change since 1720 from the majestic to the elegant and comfortable. Francois De Cuvilliès (1695-1768) brings the Rococo to the court of Bavaria in 1725 and is thus instrumental in the distribution of the new style over Southern Germany and Austria which now begin to take a leading part in the history of Rococo architecture. Cities such as *Nancy, Potsdam, Dresden, Prague, Wuerzburg, Munich, Salzburg* and *Vienna* still appear today as the exponents of this era. The castle of Sans-Souci at *Potsdam* (by Knobelsdorff, 1745), the Zwinger (by Pöpelmann, 1711-24), the court church (by Chiaveri, 1738-51) in Dresden, the Residenztheatre in *Munich* (by Cuvilliès and Effner) and the palais Kinsky in Vienna (by Hildebrand, before 1745) may well represent the secular style of Rococo architecture while the ecclesiastic architecture of Bavaria finds its greatest masters in Christoph Dientzenhofer (1655-1722) and his son Kilian (1689-1751), Balthasar Neumann (1687-1753) and the artist family Asam (Hans Georg 1649-1711; Cosmas Damian 1686-1739; Egid Quirin 1692-1750). In Austria, the Rococo flourishes in the work of Kilian Dientzenhofer (1689-1751) in J. Lukas von Hildebrand (1668-1745) and in Jakob Prandauer (d. 1727). In all the architectural creations of these masters we notice a sense for effective planning of the location in context with the surrounding nature or street architecture, a plastical handling of ground plan and elevation developed into complicated and picturesque spatial organisms of the highest order and the use of painting, sculpture and the decorative arts for the achievement of a festive total effect.

The architectures of Spain and England do not take any considerable part in the Rococo style, the one expressing itself in the chirruqueresque Baroque, the other in neo-classical Palladianism.

In sculpture, the dynamic Baroque of Bernini and his followers turns similarly toward graciousness and even affectation. The erotical genre replaces more and more the heroic. Smaller sizes and more intimate expression go hand in hand with it. However, France has expressed its Rococo phase more in its decorative arts than in sculpture. Etienne M. Falconet (1716-1791) and Jean Baptiste Pigalle (1714-1785) direct the plastical trend gradually from the Rococo toward the new classicism. It is again Germany and Austria that develop the Rococo to its most exuberant expression. Balthasar Permoser (1651-1732) exerts a strong influence on the Bavarian masters such as the earlier mentioned Egid Quirin Asam, Ignaz Guenther (1725-1775) and countless others. The typical Rococo art of china (by J. G. Boettger (1662-1719) found in Johann Joachim Kaendler (1706-1775) of Meissen its greatest master.

In painting the Rococo expressed itself in monumental fresco art as well as in the intimate entertainment genre. In both fields it produced—shortly before the neo-classical drought set in—a number of great masters. Giovanni Battista Tiepolo (1696-1770) and his sons carried the exuberant virtuoso style of his late Baroque from the castles and palaces of Venice and Madrid to those of Southern Germany and thus were instrumental in the creation of a Rococo fresco style of turbulent dynamism in the Catholic countries of Central Europe. On the other hand Venice produced in Francesco Guardi (1712-1793) a landscapist of delightful spontaneity. Francesco Goya's (1746-1828) early frescos in Madrid also reflect Tiepolo's spirit. Yet the very essence of the Rococo appears in the delicate and intimate painting of the French masters. Antoine Watteau (1684-1721) combines his Flemish and Rubens nourished naturalism with the subtlety of French court art and from it springs the shepherds and comedian genre which so deeply influences European painting for the next generation. In Francois Boucher (1703-1770) and in Honoré Fragonard (1732-1806) the elegant and the frivolous genre find their most typical expression, appearing similarly in a most refined art of book illustrations and color prints. In England, Thomas Gainsborough (1727-1788), still represents in his colorism and in his interpretation of aristocratic portraiture the characteristics of the Rococo style.

In the Rococo painting of Europe the last type of a pictorial art bound to a definite architectural system and to a definite set-up of society comes to an end. Its design and its color scheme must be imagined within the dynamic and elegant setting of the spatial and plastical compositions of the late Baroque style. **ROMAN ART** begins to rise to independence in the 2nd and 3d cent. B.C. After a period of experimentation, a synthesis of Greek-Hellenistic, Classical Greek, and Romano-Etruscan traditions is achieved under the rule of Augustus (43 B.C.-14 A.D.). The art of the Roman Empire, centering in Rome, dominates the Mediterranean during the first three centuries of our era. But from ca. 100 A.D. on regional arts gain importance. Infused with Roman elements of varying strength, these arts (Eastern Hellenistic, Asiatic, Syro-Mesopotamian, Palmyrene, Gallo-Roman) become the foundations for the rise of the Byzantine, Islamic, and European medieval arts. In various transformations, the influence of Roman art reaches into Central Asia and India.

Roman art was never entirely uniform, but if we must choose its unifying aspect is political. Man is seen as a political leader, a servant of the state, and as a faithful member of his class or profession. The Emperor symbolizes the political unity of mankind, and his portraits, reliefs, and coins reflect the imperial doctrine in the provinces. In architecture, civic buildings (fora, basilicas, palaces, amphitheatres) represent the authority of state and constitute, in the provinces, the visible proof of Romanization. These political connotations of Roman art played an important part in its revival during the French and the American Revolutions.

Roman art is frequently defined as a continuation or a vulgarization of Greek art. Roman art had, indeed, continued the anthropomorphic conceptions of Greece and had standardized them into a vocabulary that could be comprehended by primitive provincial cultures. Greek heritage endowed the Romans with the dubious blessing of a ready-made artistic vocabulary. The Roman artist was constantly torn between the stabilizing heritage of Greece and a personal bias reflecting the visual, emotional, and spiritual reality of his own day. Thus he never experienced the continued creative struggle with the surrounding phenomena that distinguished the Greek artist. The decay of Greek forms preserved without radical visual re-interpretation and adaptation to new concepts is reminiscent of the degeneration of the Renaissance-Baroque iconography in the 18th cent. The Rococo evolved certain distinguishing aspects; so also did Roman art include new departures and creative ventures. From the beginning the adopted Greek forms had indigenous functions and aims.

Architecture must perforce preserve contact with actuality. It was the dominant Roman art. The traditional Greek architecture based on the post-lintel system was gradually replaced by a system of arch and vault that sought the abstract contrast of architectural mass and interior space. The Greek wall, a unit composed of many individual blocks, was replaced in Roman architecture by walls conceived as homogeneous masses. The change was not sudden; it began in utilitarian structures that were elevated to artistic expressions (arches of bridges, aqueducts, terraces, amphitheatres). The materials necessary for this transformation were burnt brick and concrete which the Romans were the first to exploit. The emphasis shifted from the exterior to the interior of the buildings. The façades are used as "stage decoration" often masking the true character of the walls. The interior space is rhythmically formed, as in the directed movement of a basilica or as in the restful static interior of the Pantheon (126 A.D.). Light, too, is used for rhythmic effects, but this light is diffused and impersonal, not dramatic as in the Baroque. Greek architectural elements (columns, pilasters, entablatures,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

friezes) are used to decorate both interiors and exteriors but they gradually lose their tectonic function and are reduced to decorative orders. The Roman art of the Republic and the Early Empire is still dominated by traditional Greek forms. The trend toward a more abstract architecture, which grows in the second and third century A.D., finds its ultimate logical expression not in the basilica of Constantine (306-312 A.D.), which is the last great pagan building of Rome, but in the Byzantine church of Sta. Sophia in Constantinoples.

With a Roman building the parts are subordinated to the total effect. In a similar way the individual building is subordinated to a strictly planned complex of buildings. An early form of strict **axial planning** appears in the designs of Roman camps and colonies (Ostia, 336 B.C.) and in temples precincts (Largo Argentina, Rome, 3d and 2nd cent. B.C.; Ostia, 1st cent. B.C.) in which several temples are set in a row. Planning of large architectural units and zones was perhaps the most enduring contribution that the Romans made to European art. Roman Imperial Fora provide examples of isolated architectural zones symmetrically planned on a long axis. The vista is often dominated by a temple on a high **podium.** Originally, the **Fora** were market places and "commons", but under the Empire they served to commemorate events or personalities and to symbolize the power of the Roman state. The greatest example of "Roman magnificence" was the Forum of Trajan (113 A.D.) a memorial of Roman victories over the Dacians. Entering through a triumphal arch the spectator saw a vast oblong enclosure bordered by porticos. A basilica stood at the end opposite the entrance. The traditional rectangular plan of the forum was changed by the architect Apollodorus with the inclusion of two semi-circular projections from the long sides. Behind the basilica the spiral column of Trajan flanked by two libraries, accentuated the main axis. The precinct climaxed monumentally with the temple of Trajan (added under Hadrian). Excepting the high wall which surrounded the whole Forum, the buildings were of marble and were profusely decorated with sculpture.

Roman temples of rectangular plan were conservative adaptations of Greek models, but they often included an apse in the cella and omitted the columns in the rear. Their interest lies in the monumental scale and in the profusion of ornament (Republican temples of Largo Argentina, Rome; Mars Ultor, Rome, 2 B.C.; "Domus Aurea", Nimes, 16 B.C.; Venus and Roma, Rome, 135 A.D.). In grandeur of conception and symmetry of planning the temple precinct of Baalbek (Syria, 1st to 3d cent.) rivals the Imperial Fora of Rome. The circular and polygonal temples (Tivoli, 1st cent. B.C. Temple by the Tiber, Rome) eventually drop the Greek colonnade and become identical with similar types of fountain houses, funeral monuments, and civic buildings (Pantheon, Rome; Fountain in the Licinian Gardens, 3d cent. A.D.; Mausoleum of Sta. Constantia, 354 A.D.). This type of central building had a persistent influence upon Early Christian and later European art (G. Rivoira, Roman Architecture, 1925). Roman palaces were at first enlarged houses (Golden House of Nero, Rome 64-69 A.D. Palace of Flavians, Rome, 92 A.D.), but later they became immense castles planned on the axial scheme of a Roman camp (Diocletion's Palaces in Spalato and Palmira, 298-305 A.D.). Roman baths based on a plan of ornamental symmetry which combined rectangular, circular and polygonal rooms, achieved in their huge vaulted halls an effect of majestic space that dwarfs human beings (Baths of Caracalla, 212-216 A.D., of Diocletian, 298-305 A.D., Baths in Trier).

The Roman basilicas which served as courts, community halls, and club houses are basically triumphal highways, bordered by one or two-storied colonnades and roofed over. Their protypes are the colonnaded streets of the Roman East (Antioch, Palmyra, Gerasa). Basilicas sometimes included apsidal chapels at the ends. Their function as community halls may have influenced the Christians to select this type for their churches (Basilicas: Pompeii, ca. 100 B.C.; Ardea, 80 B.C.; Julia, Rome, 12 A.D.; Ulpia, 112 A.D.; of Junius Bassus, 331 A.D.; and many examples in the provinces. Christian: Old St. Peter's, 326 A.D.).

Theatres (Marcellus, Rome, 11 B.C.; Orange, France, 50 A.D.; Aspendos, Asia Minor, 170-180 A.D.), amphitheatres (Colosseum, 80 A.D.), city gates (Autumn, Miletus, Treves), libraries (Timgad, Ephesus) and even bridges and fortifications were treated with the same feeling for grandeur, rhythmic decoration and perspective effects (vistas).

In sculpture, the study of the isolated human figure attracted little interest. Some new types, however, were created to express Roman ideals of service to the state; the cuirass statues comprising a long series from Augustus of Primaporta (19 B.C.) to the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Colossus of Barletta (360-370 A.D.), the toga statues which begin with the fine bronze figure of the "Orator" in Florence (100 B.C.) and continue into the Byzantine Period, and the seated statues of consuls and emperors. Most of the statues in the round were closely modelled on Greek prototypes as were the legions of decorative statues and reliefs which adorned Roman public and private building enterprises. Schools of copyists (ca. 100 B.C.-200 A.D.) supplied the majority of these commissions. Like all academies, these schools offered little incitement to originality, but contributed a certain technical competence and even virtuosity. In judging Roman sculptures we should remember that they were designed as parts of definite settings, not as isolated monuments.

The Roman conception of reality showed primarily a keen observation of an individual phenomena. There resulted a strong interest in individualistic portraiture. The earliest original achievements of Rome are the late republican portraits (100-30 B.C.), prosaic conceptions in which each feature is recorded with disarming honesty. The portraits of the civil wars (Pompey, Caesar 50-30 B.C.) show an attempt to reconcile an unrelated observation of individual traits with a dynamic, psychological conception of personality. A compromise, based on cool Classicistic dignity and aristocratic refinement, is achieved in the portraits of the Augustan age (30 B.C.-20 A.D., Augustus, Octavia, Livia). The Roman eye for human fallibility records its observations with greater formal refinement and psychological penetration in the portraits of Augustus' successors (Claudius, Vatican, Nero). An intentional return to Republican honesty under Titus and Vespassian (69-81 A.D.) yields to courtly, affected portraiture under Domitian. The sculptors now begin to exploit optic effects in their quest for subtle differentiation of sentimental moods.

The heroic period of Trajan produces magnificent portraits that summarize the commanding attitude of Imperial leadership. With the cultured dreamers of the Hadrianic era (117-138 A.D.) begins a withdrawal of the human being into reflective meditation. The hardness of structure is abandoned for surface charm and scintillating contrasts of light and dark. The startled, cautious portraits of the anarchic third century are at first rendered in loose "impressionistic" forms. After Gallien (258-268 A.D.) the disintegrating physical features petrify into patterned masks penetrated only by magnetic widened eyes. And realism in portraiture is completely supplanted by a spiritual symbolism.

Historical reliefs, derived from the poster-paintings of triumphal processions pass through similar phases. After superficial experiments with Greek formulae (frieze of "Domitius Ahenobarbus", ca. 100 B.C.), the first Imperial program in marble appears in the friezes of the Altar of Augustan Peace (13-9 B.C), which sets the pattern of idealized historical reality that continues to characterize Roman historical reliefs (Arch of Titus 81 A.D.). The most remarkable type of pictures are the "idyllic landscapes", reflecting the Roman feeling for civilized Arcadian nature, a nature interspersed with evidence of human life—villas, statues, and small groups of people. The column of Trajan ( A.D.), is a continuous account of the Dacian wars with many short-hand details of armies, tribes, landscape, and architecture. These compositions stem from the same illustrative tradition that we find in a Hadrianic mosaic of Egypt from Preneste, in the Jewish wall paintings of the Synagogue in Dura (Mesopotamia, 3d cent. A.D.), and in the Christian Joshua Roll (Byzantine copy, after an original of 4th cent. A.D.).

Most of the Roman painting we know is little more than interior decoration. For over a century Roman decorators strove for a three-dimensional illusion. The trend to dissolve the surface of the wall into a sequence of receding vistas reaches its heights in the Flavian period (Fourth "Pompeian" style, ca. 80 A.D.). Although the Romans had developed a graded and varied palette and achieved considerable skill in a three-dimensional portrayal of isolated objects and groups of objects (partial perspective), this initial pictorial conquest of reality never reaches a unified visual effect. Later, the interest in problems of space, light, and atmosphere diminishes in favor of abstract symbolic forms. Abstract pattern, strong delineation, and rich colors become the prime objectives. We can trace this development in the paintings of houses and ombs in Rome, Ostia, and the provinces as well as in the mosaics produced over the entire Roman Empire (esp. in Gaul, Africa, and Antioch).

The rise of abstract compositions and formalized visual concepts under the late Roman Empire expresses the attempt to grasp a reality beyond the fleeting appearances of naturalistic vision. It emphasizes the shift from the physical and vitalistic aspect of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

visual reality toward a belief in a static universe of eternal, cosmic forces. This change lowered the original Roman concern for mundane realities and paved the way for expression of transcendental ideas in Early Christian and Byzantine art. See E. Strong and G. Rodenwaldt in *Cambr. Anc. Hist.* IX, XI, XII. —G.M.A.H.

**Romanesque architecture** (11th and 12th cents.). Romanesque architecture presents the revival and application of Roman principles of construction, especially the use of round arch, barrel vault and cross vault. The title is therefore pertinent, for it declares the essential contribution of the style, the renewal of Roman engineering in the art of architecture.

It is true that the application was limited to ecclesiastical structures, judging from surviving material, and in this respect differs from the elaborate social usage of the Roman Empire. Civilization of Europe in the middle ages had no such requirements as are represented in Roman architecture. The knowledge and use of concrete failed entirely, and was not revived until modern times (125 years ago in Portland cement).

About the year 1000 men wearied of the barbarian experience and began to work their way out. They were specifically tired of the task of restoring such churches of the old Roman basilica style as they chanced to possess, with their unstable walls and column supports and their wooden roofs easily wrecked in times of war and disorder.

Most of the churches erected in the age of barbarian violence and adjustment had been on the Roman pattern, as the tribes received Christianity from the Roman missionaries and docilely accepted the rule of the See of Peter. There were of course many exceptions and modifications as in Saxon England, in Gothic Spain, Lombardy, Merovingian France, and many other areas, all of which invite the theories of specialists. Well known is the attempt during the Carolingian renaissance to adapt the Byzantine style with cupola (Charlemagne's minister at Aix-la-Chapelle c. 800). But the Byzantine did exert constant influence all through the Romanesque period and even resulted in the construction of domes on pendentives and squinches as in the Aquitainian group in France (Augoulême, Périgueux, Souillac). It may have stirred interest in the idea of the erection of cupolas over crossings, which had large development in Romanesque. But the core of the matter is that the style developed on the heritage of the T cross plan of the early Christian Roman bailica, with three aisles and transept.

The energizing influence in the Romanesque contest with barbarism was the Church, the depository and source of such intellectual treasure as the age possessed. All men were Christian by right of birth and accepted Christianity thankfully and with emotion. The Church likewise had been purified and was ruled by a group of reforming popes under strong monastic influence. Monasticism at the time was resolute and intelligent and very active. Christian society and its institutions were international and universal, but flexible enough to permit great variety in expression. This was also the period of the earliest and most worthy of the crusades, an exploit in history which knows no equal. Scholars likewise were originating an intellectual movement which holds an assured place in philosophic thought.

In harmony with the activity thus let loose the art of architecture began its revival. Romanesque architecture accordingly presents the contribution of many varied minds of diverse racial stocks, united in their instinctive striving for an undefined objective, but never arriving at complete expression. There is no single example which may be said to constitute the style. Romanesque style is assembled from the examination of all the existing and varied examples. The great diversity in experimental creation and expression is a reason why Romanesque architecture is of constant interest. And yet it is a true style, consistent within itself, and is easily recognized. Of course not the least reason for its significance is that its experiments led directly to the final satisfaction afforded by Gothic.

Requirements represented in the architecture consist of stable, powerful structure for the impressive and mystic presentation of the Christian liturgy (in which the function of music of the age should receive greater attention), and the ordering of space for such effects, and specifically inviting the frank outpouring of dynamic emotion which characterizes the barbarian experience, finding satisfaction in the vigor of creative energy. A special demand was that of wall decoration, esp. sculpture, which the Western Church in opposition to the Eastern had never renounced and now revived with wild emotion. The sculpture was in true association with architecture, even when not suggesting structure, and was accordingly flat. (Very revealing

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

estimates of periods in civilization, including the present era, are implicit in the criterion of how men relate the figure to the wall. For example, in the Gothic age the figure came forth fully.) The technique of mosaic languished, but fresco painting had free expression in some areas, especially in the south where climate suggested that windows be suppressed in favor of wall. (C. Post, *History of Spanish Painting,* vols. I ff.)

The ground plan, required by the Western liturgy, is that of the three-aisled basilica focusing attention on the altar. But at once the transept began to move west, affording the plan of the Latin cross. The choir was thus made longer, and the side aisles continued around the apse, resulting in the ambulatory, from which a necklace of chapels radiated at times. The veneration of the relics was the reason for the marked increase in chapels, as for example, Cluny and the pilgrimage shrine of *Santiago de Compostela.* There was endless variation in plan. Thus in Germany there was the demand for two choirs, with transepts, at both ends of the nave, probably because of monastic usages. Examples at Cologne feature large rounding of the transepts with consequent enlargement of space from the crossing, whereas in Norman England there was a general tendency towards straight terminal walls for choir and transepts, resulting in a military effect, stern and forbidding without and secure within. Here begins the English custom of lodging the altar against the wall. In almost all cases the intersection of nave with transept marked the rise of a cupola of some sort.

In elevation marked innovations occur. There is no particular search for height (with exceptions). Height is regularly an exterior effect and is in cupolas or towers which punctuate the crossing, or towers associated with the transepts (as in Germany) or incorporated in the façades, as in Norman practice, possibly resulting from the observation of churches in Syria by the crusaders. Towers, however, never attain a true integration with the structure of the mass of the basilica. The front elevation is triple, with three portals with round arch, recessed, marking the nave and side aisles within.

The interior is normally low and heavy, as suggested by the use of the round arch. The primary supports are walls of manifest thickness and weight and piers instead of columns for the elevation of arches and vaults. The bay system is thus revived and with authority. The walls of the nave originate the triple division of ground arcades, triforium and clerestory, but seldom with effect of height. In the vast majority of cases the wooden roof over the nave persists, but is finally supplanted by the fireproof vault.

Experiments in the construction of the vault of masonry and its support represent the essence of the Romanesque contribution. An obvious solution was that of the continuous barrel vault as used by the Romans (Clermont-Ferrand). This required very heavy walls for the support, since the outward thrust was powerful and equal at all points. Novel construction of quarter circle vaults over the side aisles helped to absorb such thrust, but the experiment suggested further innovation, such as supporting the vault on arches thrown transversely across the nave, lodged on piers of the bay and fortified on the exterior by heavy pier buttresses attached to the wall (St. Sernin, Toulouse and *Santiago de Compostela*).

Such experiments called attention to the functions of the bay and the use of the intersecting vault, employed already in the construction of side aisles and perfected by the Romans centuries earlier. But the knowledge of the properties of concrete used by the Romans was lost, together with the sources of supply. The crowning achievement of the Romanesque builders thus lay in their bold exploit of constructing the segments of the cross vault of a bay on ribs, attaching the ribs to the mass of the four great piers involved (resulting in the compound pier) and thus visually transmitting to the ground the thrust which originated in the crown of the bay and which naturally concentrated upon the four piers (St. Ambrose at Milan). Each bay buttressed the next on the long axis of the basilica, the terminal buttress masses being the choir and the powerful end wall, often developed with narthex or porches. The thrust along the cross axis of a bay presented a more difficult problem, never solved satisfactorily in Romanesque. The obvious solution was to throw the thrust over the side aisles by further extension of the principle, as at Milan where an alternate pier created two bays in the aisle to one in the nave (but with incomplete visual expression), or by use of the quarter circle continuous vault (St. Stephen at Caen) and finally by half arches over the aisles, corresponding to the piers, but concealed by the slant of the roof (Church of the Trinity at Caen). These segments of arches were, however, true flying buttresses and all that the Gothic builders

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

had to do was to expose them over the roof. Pier buttresses attached to the exterior side walls completed the solution of thrust.

It is clear that when the four piers of a bay mark a square and ribs describing round arches are lodged upon them the diameter of the arches of the diagonal ribs will be greater than those of the longitudinal and transverse, with consequent effect of a dome. A procession of domical vaults is very impressive and is in the spirit of Romanesque, denoting slow, stately approach to the altar, but it did not appeal to the Norman builders employed by William the Conqueror. Accordingly at Caen, seeking greater height, they employed the alternate pier of full height for the support of a third transverse rib, thus dividing the bay into six parts, and also arbitrarily broke the profile, making the ribs in part seek vertical and in part horizontal directions, with consequent elevation of the intersecting vaults to a common level. The result, however, was awkward, but it led to the Gothic solution, pointing the ribs and reducing the bays to rectangles.

Such is the general trend of the Romanesque development. It is to be remembered that there is abundant regional variation and experiment, such as the effects achieved in Lombardy (corbel string, polygonal lantern, cupolas and the very graceful Lombard porch); the marble style of Tuscany (blind arcades, gallery arcades in subtle ordering); the Norman style in Sicily, not to mention Normandy itself and Norman England; sectional variations in France, in Spain and in Germany, and that the style has vitality within itself is shown by the work of Henry Richardson in America in the 19th century, followed by Bertram Goodhue.

Romanesque architecture is of the very essence of the medieval experience. There is no swift advance on the axis of the nave. Massive piers hold the eye, and the round arches with their repeated return downward suggest by their rhythm slow and stately progress. But full consolation is afforded by the altar and its mysteries, exposed to view for man's veneration and love. It is an architecture of emotion, of faith undisturbed by question, the authentic art of an authoritative Church, and its symbol is the strength and form of the round arch. See A. W. Clapham, *Romanesque Architecture in Western Europe,* 1936; A. K. Porter, *Lombard Architecture,* 4 vols., 1917; R. de Lasteyrie, *L'Architecture réligieuse à l'époque romane,* 1929; C. Ricci, *Romanesque Architecture in Italy,* 1925; T. G. Jackson, *Byzantine and Romanesque Architecture,* 2 vols., 1920; C. Ward, *Medieval Church Vaulting,* 1915; Robb and Garrison, *Art in the Western World,* 1942. —C.D.L.

**Romanesque style.** See GERMAN ART.

**Romanists.** A group of Flemish painters who worked in Rome under the influence of Raphael and Michelangelo. They called themselves "Romanists" to signify their devotion to Italian art. Among these artists were Jan Gossaert (Mabuse), Van Orley and Frans Floris. They are often referred to as the Italianizers (q.v.). —R.L.W.

**Roman notation.** See NOTATION.

**Roman school.** See mannerism.

**Roman theatre.** See THEATRE.

**romantic ballet.** The term "romantic" is not applied in ballet discussion as opposite to "classic" (or the traditional academic line), but rather as a stylistic department of it. The "romantic" division of the classic repertory originated ca. 1830, as a parallel in the lyric theatre of the movement headed by Victor Hugo and Byron in literature, Delacroix and Gericault in painting. *La Sylphide* (Phillippe Taglioni, 1832) and *Giselle* (Coralli, 1841) are two typical romantic classic ballets, costumed in gauzy white skirts (*ballets blancs*). The subject matter in both cases is an imaginative search for a vague ideal. *Les Sylphides* (Fokine, 1909) is a twentieth century pastiche of this style, without definite subject but with the poses and atmosphere derived from the earlier works. —L.K.

**Romanticism.** From the French *Romance*-like. In the 17th and 18th cents. used for: strange and unusual as in a "romance". The term in this general sense can be applied to any period in which the emotional and the imaginative qualities in art and life are stressed. In this general sense, one has spoken of "Romantic" trends in Venetian painting, German art, etc. It thus becomes the expression of a basic attitude opposed to the "classical" with its stress on the rational, the definite, and the harmonious. Yet, we are here concerned with the other usage which applies the term "Romanticism" to the definite period between 1800 to 1840/50.

Through the German writers Tieck, Novalis (Friedrich von Hardenberg), the brothers

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Schlegel, Schelling, and Fichte, the early Romantic School established around 1800 the philosophical and poetic foundations of the new "religion of the infinite". It represented a reaction of the European, esp. the Northern spirit, against the rationalism and classicism of the Mediterranean spirit. Its first indications appeared already in the 2d part of the 18th cent. in the English sentimental and in the Gothic novel, in garden architecture, in the German "Storm and Stress" movement, and in Rousseau and his followers. Romanticism in the German school valued emotion against reason, the subconscious against the conscious, divination against deduction, the individual against the typical, the folk against humanity, history against utopia, the demonic, night and moon against the enlightened hero, the day and sunlight, irony against bathos, the organic against the calculated, the musical against the sculptural, becoming against being. The Romantic theory appears condensed in the statement of Novalis:

"The world must be romanticised. In giving the usual a noble sense, the ordinary a mysterious appearance, the well known the dignity of the unknown, the temporal a perennial aura, I am romanticising" (Fragments VI, 100).

We owe to Romanticism a new understanding of folklore and fairytale, of world-poetry, of individual psychology, of historical writing, of mythology and religion. While German Romanticism by its medieval and Christian ideals became connected with political restoration, French Romanticism showed itself politically active, joining in with ideals of a liberal progress. This later French phase of Romanticism has more similarity with the English version of it as represented by Lord Byron and Shelley. Exalted egotism clad in *Weltschmerz*, escape from the now and here into the exotic, the abnormal, the passionate have transformed the cosmic, religious, philosophical and introvert early Romanticism into a worship of the dynamic forces of "Life" as they are expressed in the subconscious, in nature, in the people, and in the nation.

In the Fine Arts accordingly a definite difference will be noticed between early and late Romanticism, between German and French Romanticism.

*Germany*: In Germany, Romantic painting developed in direct contact with the Dresden circle of the literary movement of Tieck and Novalis. Philipp Otto Runge (1777-1810) and Caspar David Friedrich (1774-1840) strove for a new landscape art which wanted to make nature the symbol of Christianity, thus relating the cosmic universe to historical religion. In 1810, for the first time, a landscape painting (by Friedrich) was placed over an altar of a Christian chapel. Besides Romantic landscape painting, the revival of religious art under the so-called "Nazarenes" (q.v.) which, since 1810, spread out from Rome, is esp. significant. Under its devout leader Friedrich Overbeck (1789-1869) it exerted influence on English and French religious art as may be seen in the work of some of the pre-Raphaelites and of Hippolyte Flandrin (1809-1864). The revival of historical and religious fresco painting under such artists as Peter von Cornelius (1783-1867) and Alfred Rethel (1816-1859) is an outgrowth of the Nazarene School. In the 30's the transcendental character of Romantic art changes into a simple, homely, imaginative, and story-telling art as exemplified in the paintings of Moritz von Schwind (1804-1871), the friend of Franz Schubert, Ludwig Richter (1803-1884), esp. famous for his innumerable woodcut book illustrations, and Karl Spitzweg (1808-1885), the humorist and most progressive colorist of the "Biedermeier" (q.v.) spirit. In the field of sculpture and architecture, the Romantic era continued in the neo-classical vein. Yet the imitation of medieval ecclesiastic architecture became increasingly a challenge to the neo-classical style. Carl Friedrich Schinkel (1781-1841) and Leo von Klenze (1784-1864) are the outstanding architects of the periods who built according to needs in the classical, the medieval, or the Renaissance style. Out of Romanticism grew on the one hand the sentimental "entertainment art" of the Munich and Düsseldorf School which exerted considerable influence on American art and taste; on the other hand, the art of naturalistic landscape and portrait painting, fostered by the Romantic "devotion to the minute" (*Andacht zum Kleinen*).

*France*: There is nothing comparable to the religious early Romanticism of Germany in French art. The heroic mood of the revolutionary and Napoleonic days had inspired the artists with a more activist feeling toward the contemporary. In the hero worship and the military paintings of Antoine Jean Gros (1771-1835), the classicist style was already tainted by romantic exaltation of form and content. A trend for *la sensation* (the sensations) of reality became combined with a new interest for the cruel, the morbid, the passionate, and the exotic. Dante,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Shakespeare, and Byron provided the fuel for the Romantic flame. Politically the Romanticists lined up with the opposition against the Bourbon restoration—classicism became identified with reaction. The influence of the liberal ideas and manners of England and of their naturalistic landscape art (Constable) was strongly felt. The sensualism of the period found new inspiration in the Orient, especially in the French colonies of Tunisia and Maroc. The realization of the new ideals asked for changed means of expression. The classicist doctrine of pure linearism (q.v.) and restrained color seemed unfit. The rehabilitation of color and the subordination of line in the work of Théodore Géricault (1791-1824) and in that of the leader of the Romantic school, Eugène Delacroix (1798-1863) represent a creative contribution to the adequate expression of the Romantic concepts. Nourished by the study of Michelangelo and Rubens, a baroque element appears in the endeavor toward dramatization of content, line, and color. As in German Romanticism, a new impulse toward naturalism can be observed. The greater flexibility of the Romantic type as compared with the doctrinary classicist, his sense for the undiscovered and the intimate made him willing and curious to look at nature with open eyes. The later naturalistic artists felt clearly that they owed much to Delacroix' naturalistic (and with it, coloristic) discoveries. In its blend of the Romantic with the naturalistic, the Barbizon School (q.v.) (or school of 1830) of landscape painting was the world's favorite by the middle of the 19th cent. The lyrical and the heroic became symbolized in moods of nature. Théodore Rousseau (1812-1867), Charles Daubigny (1817-1878), but foremost Camille Corot (1796-1875) imbued their naturalistic approach in color and design with a superimposed Romantic "idea." The "entertainment" genre of Romantic painting was skillfully provided by Ary Scheffer (1795-1850), Paul Delaroche (1797-1856), and Leopold Robert (1795-1835). The Romantic current became increasingly counteracted since the middle of the century by the realistic art of Gustave Courbet (1819-1877) and his followers.

As in Germany, Romanticism in France has not created a style of its own in the field of sculpture and architecture (with the exception of the Neo-Gothic fashion). Yet out of this Neo-Gothicism grew the way-leading contributions of Eugène E. Viollet-Le-Duc (1814-1879) in the field of restoration of medieval architecture and of medieval architectural history.

*Other countries*: None of the other countries has contributed essentially to the making of a Romantic fine art. Yet the sentimental or sensational features of German and French Romanticism have provided germs of corruption in the general decline of the arts in the first part of the nineteenth century. The Belgian school of history painting with its emphasis on heroic calamities as seen in the huge canvasses of Louis Gallait (1810-1887), Edouard De Biefve (1808-1882), and Gustave Wappers (1803-1874) exerted some influence on Central European art. In England the art of William Blake (1757-1827), William Turner (1775-1851) and the pre-Raphaelites shows an intrusion of Romantic concepts in form or subject-matter without ever being fully a part of the Romantic movement. In America the half Romantic, half naturalistic style of the middle of the nineteenth century was introduced by Emanuel Leutze (1816-1868), Eastman Johnson (1824-1906), and George Inness (1825-1894).

In conclusion one may state that Romanticism has nowhere found a stylistic expression of its own in the field of architecture and sculpture. In painting it is also more a changed emotional content and a new subject-matter than a different form that we find. Only in French painting, Romanticism has expressed itself with a new, anti-classicist style of dynamic color and composition. Romanticism was more a literary movement and a universal mood than a stylistic phenomenon of the arts. **romantic novel.** See NOVEL, THE.

**rondo, rondeau.** (1) An old dance form with alternating solos and choruses. (2) A composition in which a principal theme appears at least three times with contrasting episodes between the repetitions. See MEDIEVAL MUSIC.

**rood.** A cross or crucifix generally standing on the rood screen (q.v.) or attached to the vaulting of the entrance to the chancel of medieval churches. —L.L.

**rood beam.** The beam supporting a rood (q.v.) in medieval churches. —L.L.

**rood screen.** The partition separating the part of a medieval church reserved for the use of the clergy from that intended for the use of the public. The rood screens were often richly decorated by sculpture. A famous example is the rood screen of the West Choir of the Cathedral of Naumburg on the Saale, Germany, dating from about 1250. A late example is the Jubé or rood loft of St. Etienne du Mont in Paris. —L.L.

**roof.** *Arch.* The exterior upper covering of a structure. (2) Any top covering.

**root.** *Mus.* The tone upon which a chord is built, i.e., the chord's fundamental bass.

**rose.** A circular ornament conventionalized from a full blown rose.

**rose du Barry.** See CERAMICS II.

**rosemaling.** See SCANDINAVIAN ART.

**rose Pompadour.** See CERAMICS II.

**rosette.** A circular conventionalized ornament with leaves or petals of any one of various shapes arranged regularly around a center.

**rose window.** A round window with ornate radiating tracery.

**rosin.** This name, sometimes confused with resin, is now usually given as a substitute for colophony to designate the hard residue left after spirits of turpentine has been distilled away from the balsam of pine trees. —G.L.S.

**rota, routula.** See rondo.

**roucou** (Fr.). Salmon color.

**Roudprecht group.** See Ottonian art.

**rouge.** See Indian red.

**roughing-in.** Process of laying on first coat of plaster; the first coat of plaster itself.

**roulette.** *Etch.* A small wheel running in a socket attached to a handle, which leaves the indentations of its teeth upon the metal as it is rolled across the plate. It is used to correct mezzotint plates, as well as to make designs which take on a special character from the tool used. A roulette print can be easily distinguished by the pattern of little teeth marks on the plate. The roulette is difficult to handle and is not often used. See PRINTS AND PRINT PROCESSES. —K.K.

**roulette** (an intaglio process). Prints made with a roulette are essentially the same as drypoint, with one exception. Instead of using a point to produce the burr, a small wheel, running in a socket attached to a handle, is used. This leaves the indentations of its teeth upon the metal as it is rolled up and down the plate.

The roulette is often used by mezzotinters to add darks in places that have been scraped too light. It is also used occasionally on aquatint and drypoint for corrections and additions.

The roulette is extremely difficult to control, but in the hands of an expert it can be made to yield most unusual results. —K.K.

**round.** *Mus.* A special kind of "perpetual canon (q.v.) at the unison" for two or more voices.

**round notation** (hagiopolitan). See eastern chants.

**rounded.** *Book.* (1) Rounded back; a book that has had the back of the folded sections hammered or rolled until it forms the segment of a circle. (2) Rounded corners; when the front corners, either top or bottom or both, of boards are rounded to prevent the wear of friction. See EDITION BINDING. —H.E.S.

**roundelay.** A song characterized by a continuously reiterated refrain.

**Rowen ware.** See CERAMICS II.

**Roxburghe binding.** *Book.* Leather back, quite plain except for lettering, cloth or paper

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

side, top gilt, front and bottom edges untrimmed. Sometimes half-Roxburghe to denote leather corners.

**royal.** See book sizes.

**royal Axminster.** See carpet structures.

**royal canopy.** See SYMBOLISM IN FAR EASTERN ART.

**rubbed.** In masonry: Surface of a stone rubbed as smooth or as regular as possible. The work is usually accomplished by rubbing one piece of stone with a second piece.

**rubber.** Although widely used in industry, this material seems to have acquired little place in the fine arts. It has been developed very slightly for coatings, synthetic varnishes being made from chlorinated rubber. This provides a film with good protection against smoke, salt spray, and fumes. —G.L.S.

**rubbing.** An impression on thin tough paper made by moistening the paper and patting it into the interstices of the relief, or into the incised parts of a carved or modelled surface, then tapping it with an inked pad, producing an actual-size image in ink on the paper. —J.A.M.

**rubble.** (1) Term applied to natural stratified, or broken stone which does not permit laying with uniformly thick joints; or dressed stone not permitting horizontal joints. (2) Term applied to masonry construction which is usually classified under two main divisions: (a) Uncoursed rubble or random rubble. — Rubble masonry laid without any attempt at regular courses, or continuous horizontal joints. (b) Coursed rubble or range work. — Rubble masonry laid with continuous horizontal joints. (3) Term also applied to a mass or fill, as the core of a wall, composed of rubble stone generally laid in mortar, as of mud. —J.M.M.

**rubble ashlar.** Term applied to rubble stone which has been roughly squared to permit laying with fairly uniform and thin joints. —J.M.M.

**Rubens school.** A school of art that found its inception in the studio of Peter Paul Rubens at Antwerp in the early 17th cent. Here Rubens' baroque style influenced such artists as Van Dyck, Seghers, Snyders, and produced a fusion of the Italian and Flemish styles which proved a guiding influence on the future course of painting. —R.L.W.

**rubia.** See madder.

**rubic.** *v.* To color with red; redden.

**rug.** A covering for the floor, a mat usually oblong or square and woven in one piece. In several books rugs and carpets are referred to as identical. In fact most written information on rugs has been catalogued under the term carpets; and there seems to be good reason for assuming that the terms *tapestries* and *carpets* as used in ancient times, were synonymous with the word *rugs* of the present day, for these were spread loosely on the floor without the aid of fastenings. —B.E.J.

**Rum** (Ar.). Asia Minor.

**run.** *Mus.* A rapid scale passage.

**rune** (a derivation of the 17th—18th cent. from the Icelandic *rūn*—secret, or the old-high-German *rūna*—secret council). The name of the characters used for writing in the Scandinavian and Teutonic cultures. The oldest runic alphabet contained 24 signs; it was deciphered by means of the so-called alphabet-inscriptions found in Scandinavia, England and the European continent. The oldest known of these alphabet-inscriptions is the one of Kylver (Gotland) probably of the 5th cent. In the beginning the runes were used for brief inscriptions, cut or scratched into bone, metal, stone and presumably also into wood. The two instances of runic writings generally considered to be the oldest (ca. 250 A.D.), inscribed respectively on a shield-buckle and a comb, were found on the moors of Thorsbjerg and Vimose (Denmark). However, some findings in Styria have been interpreted as indicating that runes were used before the birth of Christ. The runes did not originate in Northern Europe but were developed from Southern European alphabets. According to the theory of the Norwegian scholar Marstrander the runes are based upon the celtic-etruscan and celtic-latin alphabets, and originated in Bohemia and Moravia in the Roman border region along the Danube.

Memorial stones erected in honour of the dead — the Scandinavian **bautasteinar** — were decorated with runic inscriptions and with simple linear designs and ornaments (ca. 6th—8th cent.); these stones are found most often within the sphere of the Viking culture (e.g. the stone of Krogstra, 6th cent., National Museum, Stockholm; the stone of Snoldelev, 9th cent., National Museum, Copenhagen). See G. Stephens, *The Old-Northern Runic*

—H.H.

**rung.** A cross-strip, generally rounded, as of a ladder or chair.

**running head, title.** *Book.* The short title of the book sometimes appearing at the top of both pages, sometimes only on the left hand of the two open pages.

**running set.** See American folk forms, in music.

**RUSSIAN ARTS.** *Painting.* Belonging originally to the Byzantine East, Russia did not inherit the classic tradition, which so profoundly moulded the peoples of Western Europe. The art of Russia, nurtured on Byzantine-Greek tradition and dominated by the Greek Orthodox Church, remained ecclesiastical and medieval long after the art of western Europe had become secularized and was aiming at the visual conquest of nature. But within its own framework, Russia produced a great art of icon-painting.

It was not till the end of the 17th cent. when Western ideas were introduced, that Russian art broke its bondage to the old Byzantine tradition. The Western tradition in Russian art is thus only a little over two centuries old, while the art of modern Western Europe, which began with Giotto, has had over six and a half centuries of development and is in direct continuity with classic art. Up to the late 19th cent., the history of European art could be written with practically no reference to the Russians.

Russia's weak plastic tradition has been ascribed to many causes, climatic, economic, political, and cultural. Certainly iconoclastic aversion to images, feudal peasant economy, and the comparatively late growth of large cities and modern industry kept the plastic arts from developing as freely and fully as in other countries.

The Russians, like most peoples of Northern Europe, have a literary rather than a plastic genius. From the beginner, Russian art was always the handmaiden of literature. Formal elements in painting were subordinated to ideas that could better be stated in words. Until the 20th cent., Russian artists seldom expressed themselves in a truly plastic way; they never produced a painting or sculpture of universal significance. Long before Soviet ideologues declared that "art is a weapon", Russian painting became an instrument for the propagation of social, national, political, and religious ideas of various kinds. The very essence of Russian painting throughout the 19th cent. was theme or "purpose painting"; its aim, never genuinely aesthetic, was chiefly to tell a story.

But at the beginning of this century, parallel with the basic social and political changes produced by revolution, the Russian arts broke with the Renaissance tradition and sought to create a new plastic expression for our epoch. For the first time, Russian artists appear in the vanguard art movements of Europe and exert a recriprocal effect on them. In the years prior to World War I and the Revolution of 1917, the tradition of naturalistic representation was destroyed in Russia. While this mutation in art coincided with the social and economic changes, it was not directly due to them but was part of the whole plastic revolution that occurred in Europe between 1905 and 1914.

The new plastic art came into prominence with the establishment of the Soviets in 1917. It had only a few short years of experiment and was followed by a gradual retrogression to naturalistic representation. This ended in a return to old Russian models of the 19th cent. In the decade between 1930 and 1940, painting had become a Russian national academic art in which all plastic advances had been expunged in the interest of what was termed "Soviet Realism" (see socialist realism).

The Western tradition in art was introduced into Russia by Peter the Great (1682-1725). The growth of cities and of industry stimulated an art of painting based on Western European models. This officially created art was supported by the aristocracy and the court circles. It had no roots in the life of the people. These were, for the most part, peasants, who still clung to primitive and local forms of expression.

From Peter's time on, art may be divided into two kinds: peasant handicraft arts, often religious and based on oriental and Byzantine motifs, and urban art dominated by the new capital, St. Petersburg. It took almost two centuries for the latter to develop and to produce anything indigenous and genuinely Russian in feeling.

Beginning with Peter's reign, professional art was in constant touch with France, Italy, Germany, and Holland, and closely reflected Europe's fluctuations in style. From the 18th

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cent. on, Russian art passed through the same style changes as in Western Europe—Baroque Rococo, Neo-Classic, Romantic, and Modern. But the tempo of these style changes was always slower due to Russia's distance from the cultural centers of Europe. Modern means of communication gradually reduced this distance until in our century, the modern art movements of Paris appeared almost simultaneously in Russia.

Peter's break with the past was so decisive and sudden that the works of art of his reign bear little or no trace of the old Russian style. For the building of St. Petersburg, his new capital on the Neva, Peter invited many foreign artists to Russia. Included were French, German, Dutch and Italians, among them the sculptors, Andreas Schleuter, Carlo Bartholmeo Rastrelli, and Pinaud; and the painters Tannhauer, Carvague, Tarsius and Pillement. The cost of maintaining these foreign visitors led Peter to the idea of educating his own artists by sending them abroad. Andrei Matvyeyev and Ivan Nikitin, two of the first painters to study in Europe, had little influence at home. Matvyeyev died shortly after his return to Holland and Nikitin, who came back in 1720, was involved in a conspiracy, knouted and sent to Siberia.

In the reign of Peter's daughter, the Empress Elizabeth (1741-1762), fantastic Rococo palaces rose on the banks of the Neva, built and decorated by foreign artists; Italians like the Grot brothers, Valeriani, Torelli, and Count Rotari, and French painters like Le Lorrain, Lagrensèe, Toqué and Develis. However, the taste of Elizabeth's reign reflected nothing of the real contemporary painters of France like Watteau, Boucher, and Chardin, but was shaped by the French Academy and its "grand art."

Elizabeth founded the Imperial Academy of St. Peterburg, which was to dominate Russian art for over 150 years. The fact that an art academy was needed in this time attests to the growing number of professional Russian artists and the necessity of providing an education for them. Among the Russian painters of this period were Ivan Argunov, born a serf; Alexei Antropov, a "master of perspective", and Makhayev, pupil of the Italian, Valeriani. Under the leadership of Count Shuvalov, the Academy turned out numerous architects, sculptors, engravers, and painters. Best known of the painters were A. Losenko, Rokotov, Sablukov, and S. Shchedrin. There also existed a large number of icon painters, who re-interpreted orthodox ideas in the Italian Rococo style. Portrait painting flourished thanks to the court. And as the Rococo palaces under the vast Russian sky assumed more grandiose forms than their European models, so 18th cent. portraiture in Russia had a more dramatic intensity than the fragile Rococo art of France.

It was under Catherine II that this Russian school of portraiture attained its full development. The most outstanding portrait painter was Dimitri Levitsky (1735-1822), who was so well known abroad that Diderot preferred Levitsky's portrait of himself to all others. Levitsky's portraits of the Russian aristocrats were executed in the style of Greuze and also under the influence of the elder Tischbein. He was a master at handling silks, laces, and jewels, but in his later life, his style became grandiose and lost its vitality. Another contemporary, Fedor Rokotov, painted the well known portraits of Catherine II, the third of which is considered her best likeness. Equally famous was Vladimir Borovikovsky (1757-1826) whose style followed the informal tendency of the late 18th cent.

In Catherines' time, landscape painting and theatrical decoration became increasingly important. One of the best masters was Fedor Alexiev, whose *Quay of Neva* shows a sense of color and technical knowledge. Silvestre Shschedrin and M. Ivanov painted perspective views of St. Petersburg. Numerous architects practised water color painting in "the English manner". Maxim Vorobyvov, who studied under Canaletto in Venice, was considered the foremost historico-architectural painter. Galktionov was the first to depict the urban bureaucratic life of the capital in a precious style. The number of painters at this time had grown enormously but few attained to more than common-place and dilettante imitations of European masters.

Toward the close of the 18th cent., the revical of the classic spirit begun by the Enlightenment in France began to effect Russia. Roman republican ideas became fashionable and the aesthetics of Winckelman, Lessing, Mengs and David were known. A. Losenko, who studied under Vien, the teacher of David, was one of the first to bring in the classic idea. He was also the first to introduce strict art training among his pupils. Headed by Akimov, last of the epigones of the rococo, the Imperial Academy fought the neo-classic tendency, which was associated with all that was progressive and revolutionary. However, this conflict between the grand manner of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the Rococo and the Neo-classic spirit ended by the Academy taking over the latter and becoming its bulwark for over a hundred years. Russian classicism, far from expressing the revolutionary ideas of David, became a vehicle for the most bureaucratic, rigid, and official ideas of the time. The Russians ceased to look to France and turned to Rome for their inspiration. The reign of Alexander I was the heydey of this academic classicism. Ugryumov, the exponent of this tendency in painting, was one of the first to essay historical subjects in his canvases *The Capture of Kazan* and the *Coronation of Mikhail Fedorovich*. His two pupils, Shebuyev and Yegorev were servile copyists of classic art. Andrei Ivanov, who had real technical knowledge, was with Ugryumov, an initiator of the "national historical genre" painting, which flourished later in the 19th cent. By the time that the Romantic movement was sweeping Europe, classicism, imprisoned in a sterile, provincial form, had been firmly incorporated in the Imperial Academy, where it exercised a deadening influence on Russian art for years.

In Russia, however, the opening years of the 19th cent. marked a period of great spiritual ferment. The invasion of Russia by Napoleon aroused a tide of national feeling that led to his decisive defeat; at the same time, the liberal, democratic ideas of the French Revolution brought by the French army, profoundly effected Russian thought. The result was the ill-fated Decembrist Revolt of 1825 led by Russian officers, first of a long series of social protests against feudalism and absolutism. At this time, Russian literature experienced a new flowering in the works of Pushkin, Gogol, and Lermontov.

In contrast to the high level of literature, the level of art was low, lower than in the 18th cent., when the influx of foreign artists had stimulated an auspicious beginning. Due to the war and the rise of national feeling, there were now few foreign artists. The great Russian literary figures were nearly all of aristocratic origin and familiar with Western culture. The new Russian artists, on the other hand, came from the middle or lower classes and had no opportunity for education abroad. Their economic condition was often bad. The landowners on the great estates frequently trained their serfs as painters and architects, even educating them in St. Petersburg, but forcing them to do menial work along with their artistic activities, and not infrequently flogging them if their art did not meet with approval.

The four best artists of the period were Kiprensky, Bryullov, Bruni, and Ivanov. Alumni of the Academy, they became its opponents and joined the Romantic movement. Kiprensky (1782-1836), a serf by origin, drew and painted the heroes of the war against Napoleon. His most successful portrait was that of his friend, the poet Pushkin. The best genre painter of the time, Tropinion (1776-1857), was also born a serf and gained his liberty only in 1823 after he had acquired a national reputation as a painter. His work prepared the way for the development of Russian realist art of the 50's and 60's.

The official leader of romantic painting was Karl Bryullov, (1799-1852), often called the "Russian Delacroix." The son of a skilled carver, he entered the Academy at an early age and was sent to Rome by the newly founded Society for the Encouragement of Artists. More ambitious than talented, he spent eight years working on a large historical canvas, *The Last Days of Pompeii,* which on his return home earned him great acclaim. His painting of *The Siege of Pskov* was one of the first of a long line of dreary national historical painting that always has been popular in Russia. Bryullov died in Rome on a second visit but his influence permeated Russian art for years. His follower Bruni (1800-1870) sought to emulate him by painting *The Brazen Serpent* in Rome. On his return, he was made rector of the Academy and held that office for sixteen years. His superficial, bombastic art was far inferior to Bryullov's work but it is the perfect example of the official taste of the period. He had countless pupils, none of whom exhibited any genuine artistic gift. By the fifties, Romanticism as a movement had become sterile and the pseudo-romanticism of Kaulbach, Delaroche and the followers of the Duesseldorf School flourished in St. Petersburg. It was the misfortune of both the neo-classic and the romantic movements in Russia that their spirit was soon smothered in official academicism and the genuine leaders in Europe were ignored for second rate epigones.

Realism in Russia grew up with the populist movement (Narodniki) and had an even stronger literary trend than in other countries. In its beginnings, realistic painting was strongly tinged with academic romanticism. This may be observed in the work of Alexander Ivanov (1805-1856), one of the most talented

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Russian painters and an important early realist. Influenced by Gogol's ideas, his style was that of Oberbeck. But he showed a far more acute observation of nature than his predecessors and his work was marked by deep sincerity. His two large canvases, *Christ Showing Himself to Magdalene* and *Christ Appearing before the People* were painted in Rome, where he spent twenty-five years. His Biblical sketches rather than his large paintings sustain his reputation as a painter.

Ivanov's successor and artistic opponent was Nicolas Guë (1834-1894), who in contrast to Ivanov's idealistic treatment of religious themes, painted stories from the Gospel with gruesome naturalistic realism (cf. his *Crucifixion*). His meticulous rendition of all that was sordid and ugly in life was in its turn an inverted idealism and part of the social protest of the group around Alexander Herzen to which Guë belonged. At the height of his career, under the influence of Tolstoy's teachings, he gave up painting. His portraits of men like Tolstoy and Herzen are the best in the second half of the 19th cent.

Ivanov's true disciples included such diverse talents as Kramskoy, Vasnetzov, Nesterov and Vrubel. Nicholas Kramskoy had an important influence on painting not because of his artistic talent but because he was an organizer. While still a student at the Imperial Academy, he led thirteen students to revolt against the classical dogma and to withdraw to form their own artel. In 1872, the year of the first great Exhibition of the Impressionists in France, he organized the Russian Union of Wanderers' Exhibitions (Obachtschestwo Peredwischnych Wystawok) in direct protest against the Academy.

The program of **the Wanderers** was didactic and social. Realism was to them a means to an end: to bring art to the people and to inspire and enlighten them, just as the various radical parties in Russia were seeking to enlighten them politically. For this reason, the Wanderers attached far more to the moral and literary aspect of art than to aesthetics. In their outlook they were part of the whole social tendency of the time which had such a brilliant expression in literature. For twenty years they dominated the scene and exercised a great educational effect by sending exhibitions into many cities where prior to this art was unknown. The chief painters of the group were V. V. Vereschagin, Ilya Repin, Vladimir Makovsky, W. Polenov, and Lebediew.

Their tendency to realism had its forerunners in painters like Venetzianov (1770-1847), who founded the first school for the study of nature, and in portrait painters like Varneck, Terebenov, Count T. P. Tolstoy, and Peter Sokolov, who was one of the few to keep the artistic aims of painting alive between the forties and the seventies. The real father of Russian "purpose painting" was F. A. Fedotov (1815-1852) and his successor V. Perov (1833-1882) who painted the portraits of Turgenev and Destoivsky. The first marine painter in Russion was Aivasoski, (1817-1900). Realistic landscape had its first exponent in Ivan Shiskin, who born in the far north, was one of the first to paint Russian landscapes instead of ideal Italianate versions of Russia. The depiction of Russian life and Russian landscape really began with Alexander II who inaugurated a liberal era by emancipating the serfs in 1861.

The most facile propagandist in paint among the Wanderers was V. V. Vereschagin (1842-1904). He achieved the greatest popularity outside of Russia, especially with his anti-war pictures. Born a nobleman, he painted Russian scenes from the viewpoint of Western culture. His large canvases with many figures have little to recommend them on the formal side.

Ilya Repin (1844-1930) was perhaps the most gifted of the Wanderers and best expressed their spirit. A pupil of Kramskoy, his natural skill led him into pictorial journalism in which he treated contemporary ancedotes from the Russo-Japanese War and from our Spanish-American War. But in his two most famous paintings *The Zaporogian Cossacks* and *Ivan the Terrible and His Son;* he established himself as a master of literal detailed realism. Among his best work are his portraits. Another portrait painter of distinction was Vladmir Makovsky. W.Polenov and Lebedjew were the landscape painters of the group, the latter painting Russian landscape with lyric intensity.

The Wanderers were part of the progressive social movement in Russia which was directed against the growing absolutism of the Czar. But following the assassination of Alexander II by the Nihilists, his son, Alexander III inaugurated a period of reaction and repressions. Censorship put a stop to all social propaganda in art. An era of official Slavophilism and a return to orthodoxy began. The reactionary atmosphere was reflected in painting by a change of theme.

Religious subject matter, national and historical scenes and landscapes became popular.

Victor Vasnetzov, another follower of Kramskoy but never a member of the Wanderers, aspired to create a "truly Russian art". He decorated the Cathedral of St. Vladimir in Kiev in the Byzantine style. Decadent and decorative in style, even his easel paintings were for the most part on religious subjects. He was the first to introduce old Russian fairy tales as a motif for painting and was thus the precursor of the Moscow revival of "Russian National Art" that began just before World War I. Another religious painter of the time was M. Nesterov (born 1862) who painted lyric scenes of Russian landscape with churches, monks, nuns and priests in the foreground. He was still living as an Honored Artist of the People in the U. S. S. R. before the outbreak of this war.

More nationalistic than religious was Surikov (1848-1916), who broke with the sentimental, humanitarian ideals of the Wanderers and recreated scenes out of the history of Russia in brilliant but sombre peasant colors. Despite crudity of execution, his talent was greater than that of Vasnetzov and Nesterov. His harsh coloring influenced Repin and the later Moscow painters. Surikov's backgrounds of old Moscow with its crenelated skylines became the theme of later painters like Appolinaris Vasnetzov and S. Ivanov.

At this time when the Realists, the Slavophiles and the Orthodox painters were on the crest of popularity, a new movement entered Russia from France. Impressionism, with its undercurrent of scientific skepticism and internationalism, was welcomed by the younger artistic forces, who were in touch with French painting and excited by the color discoveries of Monet and Pissaro. The Slavophiles fought the new aesthetic doctrine as an "insidious French influence", but the Impressionists increasingly gained adherents.

Paralleling the two streams of Russian painting—realism and decorative National painting—Impressionism had two different facets in Russia. The work of the doctrinnaire Impressionists was devoted to landscape painting of actual out-of-doors scenes and actual people; the imaginative artists depicted in Impressionist technique fantastic subject-matter, often colorfully decorative and oriental in feeling. Among the early leaders of Impressionism were W. Serov, called the "Russian Degas" and J. Levitan, a pure landscape painter. Michael Vrubel was the best of the fantastic Impressionists.

The *fin de siècle* mood of the out-going century which gave to art throughout Europe a nostalgic, precious, and symbolic character was expressed in Russia in the work of Vrubel. In his weird landscapes overcast with gloomy blue shadows and haunted by strange demons, was embodied the metaphysical yearning for another and better world. It was in this period just prior to the Revolution of 1905 that a section of Russian art sought to escape in mysticism and dreams from the oppressive rule of Nicholas II. The work of these artists who gave up painting from nature became tenuous in plastic structure and ever more illusionary. In color and technique, Vrubel remains the best artist of this tendency. Never popular during his lifetime, he succumbed to mental disease and died in 1910.

Another phase of the fin de siècle was expressed by the magazine **"The Golden Fleece"** and the group of painters called **"The Blue Rose"** which included Lancères, N. Sapanov, and Konstantin Somov. The early work of P. Kuznetzov and B. Sudeikin was in this style.

The tradition of doctrinaire Impressionism upheld by Serov and Levitan was continued by the members of the "Union of Russian Artists", most important of whom were Maliavine and Korovin. The first had the superficial vigor of the Swedish painter Zorn carried to excess in bright compositions of lusty peasant women. Korovin was known for his stylized landscapes and he became increasingly decorative and made original theatre decor. Other impressionists included men like Vinogradsky, Schukovsky, a painter of old estates and palaces, Perepletschikov, Baron Koldt, and Brytackov and K. Yuon, genre painters of rustic scenes. More experimental was J. Grabar, originally a pointillist, and Krymov, who painted in pure colors.

Following the defeat of the 1905 Revolution, the main line of Russian Impressionism following Vrubel forsook the natural world. Painting became stylized in a decorative linearism, which without much of plastic consequence, had a revivifying influence on the theatre, particularly in the settings of the Russian ballet, which was making its first tours of Europe's capitals. Most of these painters were associated with the **"World of Art" group** (Mir Iskusstva), which was organized as a protest against the Wanderers in 1890 and originally included both the fan-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tastic and realistic Impressionists. Its leader, Alexander Benois, as well as most of the others, had spent much time in Paris. "Art for art's sake" was the slogan of the whole group and they stood for interpretation rather than imitation of nature. The decorative artists included Leon Bakst, Somov, Golovin, Benois, Nicholas Roerich, Debuschinsky, Sudeikine, Stelletski, Remisoff. Interested in portraiture were Schoukhaev, Jacovlev, Sorine, Boris Grigoriev. In Russia this new decorative art had an important influence on the graphic arts, book illustration, mural painting, as well as on the theatre. Bilibine was one of the most talented of the illustrators.

Strangest of the anti-naturalistic painters was Nicolas Tschurlianis, first to abandon all subject-matter in his search for equivalent expressions in line and color for music. Although his work is plastically weak, it marks a real turning point. In this respect, he may be considered the ancestor of the Non-objective school of painters, who derive from Kandinsky. Tschurlianis died in 1911 but his painting had a tremendous vogue in Russia just prior to World War I.

At the beginning of the 20th cent., the great changes in modern life and thought produced a crisis in art. In Western Europe this crisis, marking the end of the Renaissance tradition, was manifested in various insurgent movements by a tendency to decompose the old color gamut, the old vision of space, and the object itself. Cezanne had sought to re-establish the grand structure of the past, but unconsciously he was moved to destroy it in the interest of the surface plane of the picture. Stimulated by his late work, the Cubists carried out a revolution in style, destroying naturalistic representation by concentrating on the plastic elements of painting. At the same time, the Italian Futurists, seeking a more dynamic expression in art, introduced simultaneous movement. The destruction of three-dimensional space illusion and of the natural appearance of objects led to plane painting.

Post-Impressionism, Fauvism, Cubism, and Futurism reached Russia almost simultaneously with their appearance in Western Europe. Many Russian artists were living in Paris and the fine collections of modern art brought to Moscow by the merchant princes Morosov and Schukin acquainted the artists at home with the new advances. Four years after Cezanne's death, his first Russian followers founded a group called "**Jack of Diamonds**", which included Kontschalovsky, Rodestvensky, Lentulov, Yakulov, Falk, Larionov ond Burliuk.

The latter two may also be included with the "Primitives". For at this time when the artists in Paris came under the influence of primitive and exotic arts, certain Russian artists went back to their own past for new sources of inspiration. Related to the Fauves and the early Expressionists in Germany, they were interested in forms and colors that did not imitate nature. Many of them later developed in divergent directions. They included Larionov, Gontscharova, Marc Chagall, Kandinsky, Gritschenko, Sheritshenko, and Sternburg.

One of the most gifted of the "Primitives" was Marc Chagall, who later attained the greatest reputation in other countries throughout the world. Both his work and that of Kandinsky had far greater influence outside of Russia and belong primarily to the modern international movement in art. Chagall, using motifs from Jewish folklore and the life of his native Vitebsk, created a fantastic dream world of lyric beauty, in which Cubist elements were mated with primitive color and expressionist mood.

David Burliuk introduced the simultaneous movement of the Futurists into a colorful painting design. He was one of the first propagandists of modern art in Russia, travelling and lecturing on the subject in many cities along with the Futurist poet, Mayakovsky. In his work, primitive, mystical, revolutionary and modern were combined in a personal symbolism of revolt.

Close to Burliuk was Filonov, a painter peculiarly Russian in his social, Messianic feeling. He declared himself opposed to the whole "Realist Fallacy", in which he included even Cubism, Expressionism and Futurism. His work, however, had elements of all these movements embodied in monumental canvases of apocalyptic revelations.

Larionov, in the light of cubism and futurism, revised Impressionism into what he called "**Rayonism**" (***lutschism***), a theory that dealt with dispersion and interpenetration of rays emanating from objects. He had no real adherents, but he and his wife, Gontscharova, had a stimulating effect on theatre decoration.

In contrast to the mystical and primitive modernists, the doctrinaire Cubists were not concerned with philosophical, social or literary ideas but only with the plastic problems of their art. Following the early Cubist work of Picasso and Braque. they devoted them-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

selves to compositions showing simultaneous and multiple planes of vision and the dissection of the object into its component parts. In this way, perspective disappeared in their work and the natural appearance was distorted. They also experimented in textures introduced by collage and sought to achieve pictorial unity through the imposition of varied materials onto the canvas. Called **"factura"**, this exploration of textures became so popular that a book on the subject was written by the painter Markov. Factura had its greatest effect on the Constructivists.

The outbreak of the war in 1914 brought many of the modern Russians home from the capitals of western Europe. This gave a new impetus to the modern art movement in Russia. Among the returning exiles was Vassili Kandinsky (b. 1868), who had lived abroad since 1902. One of the leaders of German abstract expressionism, he was cofounder with Franz Marc of the **Blue Riders** (*Blaue Reiter*) in Munich. The group included two other Russians, Javlensky and Burliuk. Kandinsky developed the color discoveries of the Fauves into a new plastic language of line and color without natural objects. He is credited with having made the first pure abstract painting in 1911.

In the midst of the war in 1916, Vladimir Tatlin assembled a group of artists around him; they proclaimed the death of easel painting and the birth of a new art (at first called **Tatlinism**), which found its rhythm, construction, and logic in the machine. Like the Dadaists, these artists found no material unworthy of use for art. They employed glass, wood, nails and wire constructively to create a new art language in terms of modern technique. "Tatlinism" later became Constructivism.

With the founding of the Soviet Republic in 1917, the Bolsheviks, determined to make a clean sweep of the past culturally as well as politically, made an alliance with the "Russian Futurists". These included all the extreme groups of the modern movement such as "Jack of Diamonds", the Cubists, the Primitives, the Expressionists, etc. The insurgent artists immediately discovered a parallel between the plastic revolution and the political revolution. Those who were not in agreement retired or went into exile. But to these modern artists, it seemed that the liberation of art and the artist from all traditional slavery was assured. They took a leading part in artistic reforms of sweeping consequence.

The Imperial Academy was abolished and a Free College of Arts was established in its place. Free art schools were opened and private collections were transferred to the state and opened to the public. The Morosov and Schukin collections were joined and became the State Museum of Western Art. Other museums of "Artistic Culture" were founded and the artists were employed by the new government to stage revolutionary festivals, to make posters and book illustrations. Leading modern artists like Kandinsky were invited to organize these new institutions of art.

Despite all the external disturbances that accompanied the shift from an absolutist feudal society to a new society, whose ideal was the emancipation of all men, art flourished as never before in Russia and enjoyed a brief honeymoon of experiment. Some of the experiments were bizarre and impossible of achievment, but many had a creative effect on the periphery arts. A new poster art and a new film art were born and later influenced other countries.

At this period, the modern movement in art in Russia was more direct, more logical, and more intense than anywhere else. All the various groups, to a greater or a lesser degree, moved away from the imitation of nature toward a more abstract expression. The revolution in the plastic means was characterized by the following general trends: from representing nature toward a pure plastic culture of independent works of art; from the rhythm of nature to the rhythm of the machine; from all that was timely, accidental, and subjective, toward an objective, architectonic plastic creation; and from the empirical world of appearances toward the transcendental and the purely human.

While the early Cubists, driven by the necessity of their evolution, had arrived at the surface plane of the picture, they did not carry out their discovery to its logical conclusion. Abstract art, born out of this basic change in tradition, developed outside of France, chiefly in Holland, Germany, and Russia. Of the three innovators of abstract art—Mondrian, Malevich, and Kandinsky—the latter two were Russians.

Kasimir S. Malevich (1878-1935), one of the most creative of all Russian artists, began as a Fauve, developed into a Cubist in Leger's style, and was the first in Russia to make pure geometrical abstract compositions. He created **Suprematism**, whose basic principles were economy in the plastic means,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

rhythm of lines and planes in universal relationships achieved through primary color and elementary geometric forms.

**Suprematism** aimed at the creative treatment of the surface of the picture and within its severe limitations offered great variety in the rhythm of related planes, the equilibration of pure color and the relationships of full and empty space. In Malevich's work, painting was definitely emancipated from the appearance of nature. In his book *Die Gegenstandslose Welt* (World without Objects) published by the Bauhaus in Germany in 1926, he set down his principles declaring that "the art of the past, which at least externally was in the service of religion and the state, will awaken in the pure, independent art of Suprematism to a new life and a new world—the world of constructive perceptions." Among his followers were Rosanova, Exter, Rodchenko, Drevin, Puni, and Lissitzky.

The **Constructivists**, organized by Tatlin, declared that the picture itself was dead and that the necessity for creating works of art was historically past. Constructivism sought to put artistic activity to use for new social ends. Its aesthetic derived from the precision, order, and organization of the machine was directed toward the creation of dynamic constructions of concrete materials and technical processes. The Constructivists looked to science and industry as a means of educating new artists. Their investigation into the properties and function of materials and their effort to relate these materials to specific forms had many practical results in stage decoration, typography, posters and architecture.

Tatlin, a brilliant inventor, created **"counter relief"**, a sculptural relief in volume and planes of contrasting materials. His most famous work, the model for the Third International, consisted of a huge spiral built in the form of a cube, pyramid, and cylinder, these forms to rotate according to the day, month, and year of the calendar. Never erected, the model was later destroyed.

The constructivist best known outside of Russia was El Lissitzky. He held that the function of art is not to beautify but to transform and organize life, until life and art eventually merge and works of art as objects disappear in the total environment. In both these ideas and in his work he was influenced by the ideas of De Stijl and of the German abstract movement. N. Altmann, a former member of the "World of Art" became a constructivist and one of the chief designers of the revolutionary pageants and festivals. Other constructivists were Medunetzky, Popova, Varst, Ioganson, Mituritch, Kluitzis, G. and V. Stenburg, the sculptors Tchaikov, Gabo, and Pevsner. The latter two went abroad later and had a great influence on the development of abstract sculpture in France and England.

For a short time, the Constructivists were the leading exponents and representatives of revolutionary proletarian art. For the most part, their influence was felt outside of the creative arts—architecture, film, poster, theatre decoration. But Expressionism, the tendency opposite to Constructivism, also exercised a potent influence. In these years, Kandinsky, its personal leader in Russia, changed his art from the free colorful improvisations of his Munich period to a more somber and increasing geometric composition. In 1921, he founded the Russian Academy of Artistic Sciences in Moscow, where most of the art activity had been centered following the change of government from Leningrad to Moscow.

The first five years of the Soviet regime were the most creative period of artistic activity in the history of Russia. But the increasing difficulties resulting from the Civil War and the economic upheaval, led to the New Economic Policy of 1922 (the NEP). Private buyers and patrons reappeared and a market for traditional art was re-established. The growing demand for portraits, landscapes, and genre art brought the older schools to the fore again. The change was apparent in the public exhibitions where traditional art was again displayed.

The government, in need of funds for more vital necessities, withdrew a great deal of its support from the modern artists. Many were forced into the applied arts in order to live. Others, like Kandinsky, Gabo, Pevsner, Chagall, and Burliuk went abroad. Only a few returned to Russia like Lissitzky. The artists belonging to the extreme left were gradually pushed in the background, lost their official positions, and their work was withdrawn from public view.

By 1927, naturalistic representation was in vogue again and abstract and expressionist tendencies in art were declining rapidly. An emphasis on easel painting led to the formation of new groups such as The New Society, the Four Arts (OST) and the Society of Easel Painters (NIJ). The formation of the Artists' Association of Revolutionary Russia (AKKHR) turned the tide against

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

all modern art. It had the largest membership of any group and embraced artists of all schools and tendencies. Many members of former groups like the *Jack of Diamonds* and the *World of Art* joined AKKHR and thereby received a yearly income for doing pictures that could be bought and reproduced by the government for wide distribution among the people. These pictures were necessarily illustrative and propagandistic.

The aesthetics of AKKHR revived that of the old Wanderers. The main difference lay in the choice of theme. This government-sponsored movement had as its program the depiction of the Revolution, its history, struggles and triumph in terms of 19th cent. naturalism. It became known as "**heroic realism**". In further imitation of the Wanderers, the AKKHR sent exhibitions all over Russia on a great scale, attracting thousands of people who had never before visited an art gallery. The exhibitions were often dedicated to a single theme; they depicted subjects like May Day, factory workers, Red Army life, collectivisation, etc. AKKHR also arranged travelling scholarships for artists, who were commissioned to visit different parts of the country and to set down their pictorial record of contemporary life.

The initiation of the First Five Year Plan was considered of such importance that it was made the main theme for Soviet art. While some of the artists still painted in styles reminiscent of the now defunct modern movements, the main current of art rolled backward with the same swiftness as it had gone forward, recapitulating regressively the styles of Abstract Art, Cubism, Expressionism, Impressionism to a Realism in which naturalistic and romantic elements were combined. The pictures of modern artists like Malevich, Kandinsky, and Lissitszky gradually disappeared even from the state museums like the Tretyiakov Gallery in Moscow.

The fight against "formalism" in the 30's was directed against the modern in all fields of culture and it expunged the last traces of new discoveries in color and form from Soviet art. In this era, the old academic art of pre-war Russia was again enshrined in popular favor and many of the old academicians who were still living in quiet retirement were restored and given government commissions and the main place in public exhibitions. Among them were the painters I. Brodsky, V. Yakovlev, the Korin brothers, and Nesterov. Brodsky, a pupil of Repin, became an important illustrator in paint of large historical revolutionary subjects like his *Shooting of the Twenty-six Commissars* and his *Congress of the Third International.*

Painters once associated with the *World of Art* like Nogayevsky, Ostroumova-Lebedeva, and Lancères now sought to paint *Heroic Realism.* Followers like Pavolov and Dormidontov sought to portray the new Soviet construction "romantically". Petrov-Vodkin, Pavel Kusnetzov, and the Armenian painter M. Saryan, once primitives and Fauves, now painted Soviet subject matter. Masters of post-impressionism like Mashkov, P. Kontchalovsky, A. Lentulov, V. Rozdestvensky, Kuprin, Osmerkin and others returned to 19th cent. realistic painting. A romantic like Gerasimov and a landscape artist like Istomin followed suit. S. Sternburg, a disciple of the School of Paris and former leader of OST illustrated children's books. Old Wanderers like Kotov, Yakovlev and Krainev were in demand again as well as painters like K. Yuon and B. Johannson.

The younger Soviet painters trained since the Revolution and having little or no contact with the art outside of Russia have been from the first realist painters. A Soviet genre art akin to the old Russian genre art has grown up. It deals with anecdotes of Soviet life rendered "realistically". This realism is without pretensions to plastic quality and is often mannered and romantic. It has little of the solidity of good 19th cent. realistic painting in Europe. Among the younger men are A. Deineka and those of his direction, Antonov, Yuvalov, Zernova-Nissky. Also well known are G. Pimenov and A. Goncharov. More modern painters like P. Williams and Tischler, a talented expressionist who decorated the Jewish theatre, now essay Soviet genre subjects.

In answer to the universal demand created by the "new stress on the individual", portraiture has again become popular. There are countless portrait painters who make a living painting portraits of Soviet leaders, workers, Red Army men, Soviet heroes and even pretty Soviet girls in the style of **Soviet realism.** These portraits are often inclined toward heroic and dramatic gesture. Many of the works reveal so little knowledge of modern composition and color that they are close to American magazine illustration and have the same appeal of saccharine sweetness and ancedotal detail.

The younger Soviet artists have been given many opportunities by the government—education, scholarships, and positions. Some

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

have been sent abroad to study. The number of artists in the USSR has consequently greatly increased since the Revolution. But the fact that all art has become official and is based on old academic realist traditions of pre-revolutionary Russia has hindered free experiment and the development of real talent.

In the decade 1930-1940, Soviet art was aesthetically below the standards of Western European art and that of the U. S. A., as shown by the exhibitions sent to the Worlds Fairs in Paris and in New York. While the tendency to restore representative art and to go back to national sources for inspiration has been common to the whole of art in Europe and the U. S. A. in this period, it has been carried to an extreme in the U. S. S. R. The result has been to repudiate all the advances which the plastic arts made in the first two decades of this century. Part of the whole recrudescence of national feeling in Russia, the return to national academicism cannot be considered permanent. In 1935, Malevich, who had long since withdrawn from public view, died, and Soviet art lost its most creative exponent.

In our century, many Russian painters have achieved their reputations outside of their native land. Many became closely associated with the art movements that originated in France. Among those who went to Paris in the early years were various members of the "World of Art", including Alexander Benois, Boris Grigoriev, painters like Schoukhaieff, Jakovleff, and Sorine, and decorators like Stelletski, Soudeikine, and Remisoff.

Certain Russian-Jewish painters early attained preeminence in the modern art movement in Paris, among them Marc Chagall, Moise Kisling (born in Krakau and more properly Polish), Manne-Katz, and Chaim Soutine, whose expressive style is rich in color and vibrantly rhythmic.

Among the Russian painters who came to the United States after the First World War were Nicolas Roerich, painter of mystic and Asiatic themes, David Burliuk, Boris Anisfeld, and John D. Graham, a modernist combining strong primitive tendencies. In recent years, their number has been augmented by Chagall, Kisling, Manne-Katz, Soudeikine, and the Surrealist painter, Pavel Tchelitchew.

*Sculpture.* Prior to Peter the Great's reign, sculpture was virtually unknown in Russia. The Greek Orthodox Church maintained the iconoclastic prohibition of images even down to modern times. In the churches, the place of religious sculpture was taken by flat ornamentation and polychrome decoration. In the 12th and 13th cents., some churches in the Vladimir region were lavishly decorated with sculptured low-reliefs, whose motifs were derived from Byzantine textiles and ivories. Peasant wood carving was the only form of native sculpture practiced down to the end of the 18th cent. A single departure from the orthodox ban occurred in this century, when under Catholic influence emanating from Poland, crucifixes and small carved figures of saints were introduced into Russia. Owing to the lack of sculptural tradition, these works scarcely come under the heading of art.

Despite Peter's admiration for the products of Western culture, he upheld the orthodox position on sculpture. In 1724, he issued an edict banning all religious images (with the exception of plain metal crosses) from the churches. Whatever contraband religious sculpture existed now definitely came to an end. On the other hand, Peter created secular sculpture in Russia. Along with architects, artisans, and painters, he imported French and German sculptors to glorify himself and his reign. The sculptural decorations of St. Petersburg were, therefore, almost all of foreign origin.

Among the sculptors invited to Russia were Conrad Osner, who made the bas-reliefs of St. Peters (Peter and Paul Fortress); Andreas Schlueter, the builder of the Berlin Palace, and Nicolas Pineau, who came with the architect Leblond, and remained ten years. A master of the Regency style, he became the great decorator of the period. The sculptor who left the greatest impression on the new capital was Carlo Bartolomeo Rastrelli, a French-Italian, who came from Paris. His best works are the bronze statue of the Czarina Anna Ivanovna (1741) and the great equestrian statue of Peter the Great, which was modelled on Schleuter's statue of the Great Elector in Berlin.

Russian sculpture actually begins with the founding of the Imperial Academy by Elizabeth. The first teachers of the Russians were the French sculptors living in St. Petersburg. Nicolas Gillet (1707-1791) was made the first professor of sculpture at the Academy and he taught a whole generation of Russian sculptors. By the time Catherine came to the throne, these French sculptors had either returned home or had died, but she continued the tradition of inviting foreign artists, favoring the French above all others.

Russian

The most famous sculptor to accept her command was Etienne Falconet, who came to Russia in 1766 and stayed for twelve years. He brought with him his best pupil, Marie Anne Callot, who executed the busts of Falconet and Diderot now in the Hermitage Museum in St. Petersburg. Falconet's most important Russian work is the bronze equestrian statue of Peter, made famous by Pushkin's poem as the "bronze cavalier". It is considered among the most outstanding equestrian works of the century. Another French sculptor, Dominique Rachette (1744-1809) was the creator of the models for the Imperial Porcelain Manufactury. He is remembered for his small busts and medallions.

At the end of the 18th cent., Gillet's first Russian pupils were graduated from the Academy and sent to Paris to round out their studies in the studios of Pigalle, Allegrain, Bouchardon, and Pajou. The first original sculptor to emerge from this tutelage was Schubine (1740-1805), who studied with Pigalle and whose style developed close to Houdon's. On his return from Paris, Pajou was treated with contempt by the Academicians, but his busts of Catherine II and her favorite, Prince Potemkin, are considered with Levitsky's portraits the best work in the Western tradition in the 18th cent.

Other sculptors of the period included Kozlovski (1755-1802), who made the monument to General Suvorov, and Schedrine (1751-1833), who was the best decorative sculptor of the time.

The outbreak of the French Revolution temporarily dissolved the cultural ties that existed between Paris and St. Petersburg. From this time on, Rome became the artistic center for all Russian artists. Martos (1752-1833) was the first Russian sculptor to study there; he worked in the studio of Thorwaldsen, Martos' academic Classicism is exemplified in the monument of Minine and Pojarski, Russian generals decked out in Roman togas with mock heroic gestures.

In the 19th cent., Russian sculpture which had such an auspicious beginning, did not continue on the same level of accomplishment. The classical revival, which was the reflection of the French Republic and became the universal style in Europe, led to a great architectural development in Russia. But it had a stultifying effect on young sculpture. Martos, whose pseudo-classic Canovian sculpture attained great popularity, could boast of as many pupils as Gillet, but none of them exhibited any great gifts. They included sculptors like Pimenov, Orlowski, Krylov, and Sokolov.

The upsurge of national feeling aroused by Napoleon's invasion effected sculpture less than literature. But a change took place in subject matter if not in style. The first truly Russian sculptor was Mark Matveevitch Antokolski (1843-1902), in whose work the new national feeling is incarnated. He undertook a series of marble statues of the great national heroes of the past, including the *Cossack Ermak, Ivan the Terrible,* and *Peter the Great.* His innovation consisted in representing them in their national costume instead of in the draperies of antiquity. He also made a series of pagan, Jewish, and Christian martyrs, among them, *Socrates Drinking the Hemlock, Christ before his Judges,* and *Spinoza driven from the Synagogue.* The latter statue, considered his best work, had a great success at the Paris Salons. Plastically Antokolski's work was weak, his figures theatrical, but the spirit that animated them was new in Russian sculpture. He had numerous followers, among them the sculptors Bernstamm, Aronson, and Ginzburg, all of whom lived and worked in Paris. The first animal sculptor in Russia was the Baron Klodt (1805-1867) who made the equestrian statue of Nicolas I.

Until the end of the 19th cent. Russian sculpture had little development. Monumental sculpture in Russia was still practically unknown. It was only with the beginnings of the modern movement in art that new talent came to the fore. The first Impressionist was Prince Paul Petrovitch Troubetskoy, a facile portrait sculptor, who made busts and portrait statuettes of famous contemporaries like Count Witte, Rodin, and Tolstoy. Troubetskoy's one attempt at monumental sculpture, the statue of Alexander III, was not a success. The Russian sculptors of Rodin's generation were profundly influenced by him. Many of them went to Paris and remained there, among them Sondbinine, Yurievitch, and Mme. Chana Orlov.

The plastic revolution of the first decade of the 20th cent. did much to destroy the traditional conception of sculpture as a three-dimensional art of organic forms. The new analysis of plastic elements made in painting were applied to sculpture, which was purged of all literary and historical associations. From the oldest and most primitive of the arts, there emerged a new secular plastic art closely related to the realities of modern life. Russian sculptors with their primitive strength

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

untrammeled by tradition made a great creative contribution to this transformation. The sculptor who best expressed the Primitive tendency in Russian sculpture just prior to Cubism was S. Konenkov, who began as an Impressionist and was sometimes called the "Russian Rodin".

Cubism itself produced three Russian sculptors, who became leaders in the modern movement. They all developed in Paris and had little effect on Russian sculpture at home. They were Alexander Archipenko (born 1887), Jacques Lipschitz, (born 1891) and Ossip Zadkine (born 1890). Archipenko, who came to Paris in 1908 from Kiev, went to Germany after World War I and attained a great reputation there. He was one of the first of the modernists to settle in the U. S. A. His Cubist work (1909-1921) in which he used convex and concave forms had a new rhythm and great delicacy. Jacques Lipschitz came to Paris in 1909. He applied the plastic discoveries of Picasso and others to sculpture, but in spirit he always remained close to African negro sculpture and the primitives. In his later work, he returned to rounded organic forms in an original expressionist manner. Zadkine, who also began as a Cubist, has always been a primitive in his expression. This sensitive lyricism is combined with a strong feeling for the material of his craft. Both Lipschitz and Zadkine have recently come to the U. S. A.

In Russia itself, Cubist ideas either mixed with Expressionism or led to Constructivism. The first expressionist in sculpture was Boris Koroliew, whose statue of Michael Bakunin was unveiled in Moscow in 1919. In his later work, he became more abstract and sought to create a sculpture of pure plastic elements.

During the first years of the Soviet regime, every effort was made by the young government to encourage sculpture along with the other arts. In 1918, a national competition was held to which sculptors were invited to contribute models and designs for a series of monuments to be erected to revolutionary heroes past and present. About sixty models were set up in the streets and squares of Moscow for public criticism. Most of these were of negligible artistic value, but one of the best, D. Merkulov's *Dostoievsky* was later carried out in Finland black granite and set up on one of the boulevards.

In these years (1917-1921) traditional sculpture was practically abandoned for new experiments in which the interdependence of sculpture, painting, and architecture was realized. Tatlin, who combined the talents of all three arts, had a pre-eminent influence at this time, and constructivist models, practically none of which were ever completed in enduring materials, were used for revolutionary festivals and in the theatre. His invention, the *counter-relief*, was a new form of pure plastic art, in which elements of painting and sculpture were combined. In collaboration with the sculptor Gregory Jakulov, Tatlin made a series of these counter-reliefes for the Moscow Cafe "The Red Rooster." Most of the best sculptors of the time were in the Constructivist group. They included men like Rodchenko, Medunetzky, Tahaikov, Pevsner and Gabo.

After 1922, the high-tide of Constructivist experiment receded and traditional representational art was brought back. The ultra-left artists, for the most part, lost their government positions. Rodchenko gave up art for industrial design. Tahaikov returned to naturalistic sculpture. The two brothers Gabo and Pevsner left Russia for good. Pevsner (b. 1886) had been professor at the new Soviet Academy and Gabo (born 1890) had issued the "Realist Manifesto of Constructivism" in 1920. They had a great influence on modern abstract sculpture in Europe. They settled in Berlin and later in Paris. In 1933, Gabo went to England, where he became one of the leaders of the English abstract movement. Pevsner's work done in solid materials, frequently metal, is heavier in its forms than that of Gabo. The latter makes use of modern synthetic materials, including glass, plastic, and wire. He employs new kinetic rhythms and interpenetrating planes to create new forms belonging exclusively to the 20th cent. (see SCULPTURE).

The development of sculpture in Russia after 1922 followed the same direction as painting away from all that was abstract and formal toward an ever-increasing naturalism. Academic, classic, and romantic elements were mingled in a new representational art called **Soviet realism.** Detailed realistic portraiture of heroes, officials, and important contemporaries became ever more popular. The number of sculptors increased but no work of any great plastic value was attempted. In the great building plans that began to be realized in the Second Five Year Plan, architectural sculpture became important again. A tendency toward colossal monumental figures may be noted. This official sculpture has been for the most part based on classical models with realistic details. An example is

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the model for the statue of Lenin for the Palace of Soviets and the completed work of Vera Mukhina, the figures of *Worker and Kolhosnitza* (Woman Collective farmer) executed in stainless steel, which surmounted the Soviet Exhibition Building in Paris in 1937. See A. Michel, *Histoire de l'art,* Tome 7 and 8; Alexander Benois, *The Russian School of Painting,* 1916; Constantin Umanski, *Neue Kunst in Russland,* 1920; Louis Lozowick, *Modern Russian Art,* 1925; Joseph Freeman, *Voices of October*; *The Studio*; Ed. *Architecture.* Like painting and sculpture, architecture in Russia falls into three separate phases: 1) early architecture under Byzantine influence: 2) architecture in the western tradition of Europe, beginning with Peter the Great; 3) and the Soviet period subsquent to the Revolution of 1917.

EARLY ARCHITECTURE. From its earliest beginnings, Russian architecture reveals a unique feeling for color and form, which appears under the borrowed forms of other cultures and traditions. Ancient Russian architecture appears as a complex of various and curious tendencies rather than a unified stylistic achievement.

The surviving watch-towers of the Caucasus region are the earliest known architecture in Russia and they are akin the early watch towers of the Pyrannees. In Russia's forest covered regions in the north and central sections, wooden architecture early attained a great pre-eminence and even today the Russians exhibit a natural gift for working in wood. Northern wooden architecture, of which only few early chaurches exist, resembles the wooden church architecture of Norway. But these Russian chaurches also reveal a fusion of northern and eastern elements of design that has its own stark beauty. Domestic architecture was developed from log houses of simple strong structure in horizontal lines with steeply pitched roofs.

In the twelveth century, Byzantine influences permeated Russia and profoundly transformed its artistic style, leaving an indelible impress on architecture and all the minor decorative arts. The arts of Byzanz reached Russia from Constantinople and also indirectly from the Greek monasteries. Cities and villages throughout Russia became dotted with churches in the Byzantine style, built with central cupolas that increased in number and often assumed fanciful and colorful shapes. For the most part smaller than their original models, Russian churches were modified in style by the monastic churches of Greece. Despite local variations, they were nearly all based on a universal plan: a square foundation supported by four piers, surmounted by a drum, which terminated either in a bulbous cupola or an octagonal tower ending in a blunt spire. The drum was frequently raised to great height and the church entrance marked by porches with tall flights of stairs and bell towers were often attached to the church.

Russian national architecture reached its highest development between the fourteenth and fifteenth centuries. Early centers of culture like Novgorod, Vladimir, and Suzdal built noteworthy churches and convents. In the reign of Ivan III, Moscow became the most powerful state and the center of great building activity. Italian architects and engineers were summoned to build the great walls of the Kremlin, which remains today the most famous monument of old Russia. Situated on a small hill above the Moscow River, the Kremlin (which means fortified place), consists of a group of palaces, cathedrals, and secular buildings enclosed by battlemented walls having nineteen watch towers and five gates, four of whose large towers were built by Ivan the III, the fifth, the tall Gothic tower of the Spaskiya Gate being added by an English architect (Holloway) in the seventeenth century. Within its girdle of crenelated rose-colored brick walls, there still stands the Uspensky Cathedral, rebuilt by a Bolognese architect in the fifteenth century, the Archangelski Cathedral containing the tombs of the Czars, the Blagovyeshensk Cathedral, and a complex of palaces dating from early times down to the great palace of the Romanovs' completed in the nineteenth century. Exposed to attack by arms and fire, the Kremlin has at various times undergone eleborate restorations, but it still preserves the appearance of a fortified medieval city with its fantastic skyline of golden domes and crosses.

Adjacent to the Kremlin, is the Red Square (900 yards long) with the bizarre Cathedral of Vasilli Blazhennyi, whose multicolored onion cupolas seem like a vision from the Arabian Nights. Begun by Ivan the Terrible in commemoration of his capture of Kazan from the Tartars, it was not completed until the end of the seventeenth century, and suffered exensive restorations in the second quarter of the nineteenth century.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The Byzantine influence in architecture lasted into the seventeenth century in Russia and in its decadent period became mixed with Italian Rococco motifs.

ARCHITECTURE IN THE WESTERN TRADITION. The founding of St. Petersburg in 1705 marks the change in Russia from oriental and Byzantine influences to those of Western Europe. Russian architecture now came under the dominance of the West and followed its stylistic changes with great fidelity, making only necessary variations due to climatic and social conditions. Peter planned the new capital on the Neva as a "window on Europe" and intended that it should be a "New Amsterdam". But the vastness of its size, the grandeur of its scale of building, and the unconscious influence of nameless Russian workers who built it stone by stone transformed this northern capital into a city peculiarly Russian in spirit.

The first plans and buildings of St. Petersburg were conceived in the style of the Northern Baroque of Holland and Germany. Peter's first architect, Domenico Trezzini, came from Copenhagen and was thoroughly imbued with the Dutch tradition. He was responsible for the plans of the Church of the Fortress of St. Peter and Paul, the various colleges on the isle of Vassili Ostrov (later the University)and the St. Alexander Nevsky Lavra. He also laid out the city's great boulevard, called after the early Russian hero-saint, Nevsky Prospekt. Among the German architects, who played a prominent part in the first period of building were Andreas Schlueter, architect to the King of Prussia, who built the little palace of the Summer Gardens; Theodor Schwertfeger, who completed Trezzini's work on the Alexander Nevsky Monastery, and Gottfried Schaedel, who built the Palace of Prince Menshikov, Peter's powerful favorite.

Most celebrated of the architects invited by Peter to Russia was the Frenchman, Alexander Leblond, who came from Paris in 1716, bringing with him a whole colony of artists and artisans. He drew up plans for the Summer Gardens, the Palaces of Strelna and Petershof. His work turned the tide against German and Dutch taste in Russia.

Under the regency of Empress Elizabeth, who hated the Germans, French taste was exclusively fostered at court and an architectural style developed combining the old Moscow national tradition with the extravagences of the French Rococco. Elizabeth's favorite architect was Rastrelli, the Younger, the son of the sculptor who had come with Leblond. Acting as director of construction at St. Petersburg, he was responsible for the building of many palaces, including the Winter Palace, the Summer Palace, the palaces at Tsarskoe-Selo, and the palaces of great princes like Strogonov and Anitckov. The Smolny Convent and the Church of St. Andrew of Kiev were also his work. His style, flamboyant and Rococco in taste, left its mark on the new capital. His best disciple, Sava Tchevakinski, built the graceful tower of the Church of St. Nicholas-of-the-Sailors.

Eighteenth century architecture in Russia was, for the most part, however, the work of foreign artists. The founding of he Imperial Academy of Fine Arts in 1758 may be considered the true beginning of Russian architecture in the Western tradition, but it was even much later toward the end of Catherine II's reign that the first generation of young Russian architects had completed their education and were entrusted with actual building.

Catherine, who began as a friend of the Enlightmen in France, took an exceptional interest in architecture and surrounded herself with French architects, who expressed the return to more sober and classical forms that was aking place in France. Under their influence, the transformation of the Baroque and Roccoco style into the grave classicism of Louis XVIth took place in Russia. The discovery of the lost city of Herculaneum in the early part of the century had initiated a classical revival in Europe that gradually embraced all countries and was to have a great efflorescence in Russia.

Catherine's first architect was Vallin de la Mothe, who became first professor of architecture at the Academy and shaped the taste of the whole first generation of Russian architects. To him are due the majestic Palace of the Academy of Fine Arts, (built from Leblond's plans), the Pavillon of the Hermitage (later the famous museum) and the Catholic Church of St. Catherine.

The graceful, restrained style of Louis XVIth found its best exponent, however, in the Italian architect, Rinaldi, who built the Park of Oranienbaum, the Chinese Pavillon, and the Palace and Chateau at Gatchina, the latter presents of the Empress to her favorite, Prince Gregory Orlov. Perhaps the most gifted of Catherine's architects was the disciple of Palladio, Quarenghi, whose style, marked by great delicacy of proportion, is the purest at the end of the eighteenth century. Among his works were the colonnade of Alexander's Palace at Tsarskoe-Selo, the portico of the English palace at Petershof, and the little

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

theater of the Hermitage. In his old age, he was superseded by Russian architects and his plans for the Imperial Theatre and the Bourse were set aside. Starov, Russian architect was entrusted with building the Tauride Palace for Catherine's powerful minister, Potemkin. Its hall of colonnades marks the triumph of the column in Russian classical architecture.

Under Catherine, building went on not only in St. Petersburg, but in Moscow and other cities. In Kazakov, a Russian architect, who never went abroad, the Moscow style of the period was exemplified. He built the Pachkov Palace (Roumiantsov Museum) and the Razoumovski Palace in more Russian and less grandiose taste than St. Petersburg. The effect of his work was felt in many parts of Russia. Bajenov, another Russian and one of the first graduates of the Academy, spent ten years on a gigantic project for a palace which was to replace or to enclose the whole of the Kremlin.

Under Alexander I, after the great national victory of the Russians over Napoleon, building activity reached a climax. But if the French were defeated on the field of battle, they triumphed in the field of art, for the style of Napoleon, the Empire Style, became the national style of Russia and enjoyed a far greater and more widespread popularity than it did in Paris, where revolution and war confined building, for the most part, to paper projects, and brought it to a standstill with the defeat of Waterloo. In Russia what was often dry, pedantic and overladen in French Empire, became simpler, more massive, and more severly classical, and the exterior of buildings was enriched with colors of yellow, ultramarine, orange and viridian. In the work of Thomas de Thomon, foremost of Alexander's architects, the Corinthian column gave way to the Doric, and he built the St. Petersburg Stock Exchange in a style reminiscent of the archaic simplicity of the Temple of Paestum. In his period, the first important Russian architects come to the fore, among them Voroninkhine, born a serf belonging to Count Strogonov, and Zhakarov, who built the Admiralty, considered the most perfect example of the Empire Style in Russia. Last of Alexander's great architects was Richard de Montferrand, who drew the plans for the cathedral of St. Isaac, which in size and sumptuosity sought to vie with the Pantheon and St. Peter's at Rome. But despite its lavish use of precious materials, such as interior columns of malachite and lapis-lazuli, the interior appears barren and more Asiatic than classical in feeling. It was a Russian architect of Italian descent, Carlo Rossi, who created the vast architectural ensembles of St. Petersburg, such as the hemi-cycle of the Winter Palace. With his taste for over-ornate and magnificent decoration, the pure style of Empire began to disintegrate.

The political reaction which began shortly after Nicolas I ascended the throne was followed by a similar reaction in architecture which lost its grand simplicity and became more practical. Toward the end of his reign, a tendency to resuscitate the older Russian national style arose, but as little concerning its best examples were known, its most decadent period was copied. Under Nicolas II, reaction was firmly in he saddle and architecture began to decline. During the whole last half of the nineteenth century, it never regained the vigor and serenity of the Alexander period. The Church of the Savior built in Moscow by the German architect, Thon, was before its destruction by the Soviets, the most elaborate example of the garish, hollow taste of the end of the century.

The coming of the twentieth century saw new activity in Russian architecture due to the advent of industrial enterprise. Factories, commercial buildings, and enginering projects were undertaken. The newly acquired wealth of the industrial class was used in part to build elaborate residences either in the old Russian style or in the classical style. The Swedish influence and the *art nouveau* ideals of Vienna were introduced into the Russian scene, where they appeared exotic and often grotesque. The first World War in 1914 summarily put an end to all building for over a decade.

THE SOVIET PERIOD. The first years of the Soviet regime were occupied with the Civil War, the Polish War, the blockade, foreign intervention, and a great famine—events which took an enormous toll of human lives and completely disrupted the ordinary course of life. Architecture, the most stable of the arts, could not be practised under such difficult conditions.

The 1917 Revolution not only changed the political and economic structure of Russian life but it completely transformed its ideal values. New energies in all fields of endeavor were released and led to a great intellectual ferment. Architectural theory flourished as never before. The ideas of the extreme modern movement in European architecture were introduced for the first time and integrated with the new social theories. As soon as economic recovery set in, the universities re-opened; the architectural courses were

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

thronged with students of a new type unhampered by past traditions. Leaders of the new architectural movement and heads of the architectural departments were chosen from the ultra-left wing of modern art. Parallel to the same development in Western Europe, painters who had participated in the plastic revolution, became the innovators in architecture; thus modern architecture was born out of modern painting.

From 1917 to 1920 was a period of privations and of Utopian dreams, but practically no actual building took place. In the first decade after the Revolution, three separate but related tendencies in architecture made their appearanc in the U.S.S.R.: Constructivism, Formalism, and Functionalism. The first to dominate the scene were the Constructivists, who had a creative effect on architectural theory, but achieved no concrete results except in the theatre. The Suprematist conceptions of Malevich, the projects of Lissitsky, and the experiments of Tatlin received widespread attention and influenced the younger architects and designers, who produced quantities of paper projects imaginative and daring in design but often coupled with technical ignorance. Neither the actual material means nor the skilled craftsmen for the construction of a truly modern architecture were to be found. But out of the dynamism of this first period, a dream of the future took shape, which still remains a valuable archive for coming generations to ponder over.

The first post-revolutionary building was entrusted to the more conservative architects, who in spite of themselves were forced to change their conception of architecture, for the abolition of private enterprise had destroyed the individual character of architecture. The new needs of a "collective" society demanded new solutions on a great scale in such enterprises as town-planning and social institutions. The first buildings erected in the modern style in Russia reflected the stern mood of war Communism; for the most part, like the Lenin Institute at Moscow, they are grim, colorless cubes of concrete completely at variance with the exuberant, colorful spirit of the best of the old architecture. The removal of the new government from St. Petersburg back to the ancient capital made Moscow the first center of rebuilding and among the other buildings erected were the Mossel-Prom Building (1924) and the wooden tomb of Lenin (architect Stchousev), the Izvestia Building (architect Barkhine) and a series of apartment houses in the international style (architect M. Ginsburg).

The mechanistic concepts of the Constructivists were followed by an almost mystic veneration of pure form, which the Formalists indulged in. From 1920 to 1922, the heads of the architectural faculty at the new Moscow School of Fine and Applied Arts were the architects, Ladovsky and Godosov, who envisaged an objective, absolute and universal system of form. They carried out important laboratory experiments in the study of scale, the relations of rhythm, proportion and mass, statics and dynamics termed the functions of volume, which, however led to a formal symbolism.

In 1923, a young group of architects along with painters and sculptors most of whom were students of Ladovsky organized the first association of modern architects called Asnova. Many of the formalist principles were modified by actual work, but the group as a whole adhered to the idea that new revolutionary forms could only be based on the latest scientific and technical discoveries. The Asnova group were responsible for such buildings as the Stadium at Moscow, the Soviet Pavilion at the Paris Exposition, of 1925 (designed by the brilliant architect Melnikov), the White-Russian Academy of Sciences, the Palace of Labor and it also participated in exhibitions at Bordeaux, Marseilles, and Strassburg.

The defection of some of the more radical architects from Asnova, among them the talented Vesnin brothers, Barkhine, Ginsburg, and the engineer designer, Melkoets, led to the founding of a new organization in 1928. Called SASS (Section of Architects of Socialist Construction) they represented the point of view of Functionalism. They aimed to abolish all emotional appeal of extraneous decoration in architecture in the interest of scientific functioning and spatial organization, holding that the content of a building resides in its function. For them architecture ceased to be a fine art and became a problem of engineering. The influence of modern architects in Western Europe was felt in the work of many members of SASS, such as the work of Corbusier, in France, Oud and Dietveld in Holland, Gropius and Mies van der Rohe in Germany. The members of SASS took an active part in social competitions for new buildings, among their commissions being the administrative buildings of the Turksib Railroad, the Theatre of the People at Kharkov, the apartment houses of the Commissariat of Finance in Moscow.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

In 1929, Professor Ladovsky also seceded from Asnova to form the Association of Town-Planning Architects (ARU), who sought to solve the huge tasks of construction on a broader basis— theoretically in terms of spatial organization and spatial composition considered as a unity. The need for such a group was the natural outgrowth of the first Five Year Plan, which in 1928 had inaugurated the greatest building program the world has ever seen. Part of a long-term plan to completely industrialize and modernize the whole of the USSR, it brought about another epoch of foreigners in Russia. Noted engineers, architects, designers, and technicians were glad to accept contracts for work in the nation-wide building plan, which gave them greater scope for their efforts than in their home countries. On a hitherto unknown scale, plans were drawn for new cities, sea-ports, industrial centers, agricultural collectives, community and housing projects with schools, clubs, recreation parks, stadiums, new high ways, bridges, etc. New cities and sea-ports sprang into existence and building went on feverishly from the Arctic to the Black Sea, and from the Baltic to the Pacific. The first Five Year Plan was concerned primarily with vast engineering and industrial projects, the second with housing, community centers, theatres, schools etc. Out of the plan grew such stupendous works as the Dnieperstroy Dam, the electric power station at Kura, the Caucausus, the industrial cities of Magnitogorsk and Kuznetzk (now Stalinsky), the White Sea Canal and the Moscow-Volga Canal, the electrification of vast rural sections, the rebuilding of the pleasure and health resorts of the Caucausus and Black Sea Regions. The first Moscow subway was built and the plans for rebuilding the city into a modern world capital were put into execution.

The experimental period of Soviet architecteur may be said to have come to an end with the First Five Year Plan (1928) and from this time on, the whole direction of Soviet architecture changed, although many buildings were still erected in the modern international style, official directives demanded the creation of an architecture in the spirit of "Socialist Realism." This led to the founding of the All Russian Society of Proletarian Architects (WOPRA), a group which paralleled the AXHR society of painters in its aesthetic aims. While these aims were never clearly defined, WOPRA claimed priority because of its orthodox proletarian ideology, which it applied to architecture by attacking all "right" and "left" groups. Work produced by its members was eclectic, more traditional, pseudo-monumental, and in the spirit of "realism."

The conflicting trends in Soviet architecture were brought to a head and found official solution to the competition for the great Palace of Soviet in Moscow. Architects the world over and all Soviet organizations were invited to compete and over 450 designs, many of them brilliant and original, were submitted to a large Soviet commission. Competing architects included the most distinguished in the USSR and such internationally known men as Corbusier, Mendelsohn, Urbans, Hamilton, Brazini, Perret, Lebetkin, Poelzig, Gropius and others. First prize went to an American, (Hamilton) second to a Russian (Schuko) and final award to the Russian architect, Jofan, whose design, circular in shape was classical and Roman in feeling. with rich detail in ornament, painting, and sculpture.

When the second Five Year Plan went into effect, a new period began in Russian architecture. Within five years, the epoch of foreigners was over and a strong national feeling began to assert itself. Due to practical experience and the acquisition of technical knowledge which the foreign architects and engineers had bequeathed, Soviet architecture began an independent career. All the plastic and formal advances in modern architecture were rejected and efforts were made to mould a truly national style on traditional foundations. It was officially stated that the ideal peoples' architecture must be basically human, not mechanistic, and that it should appeal to the emotions through ornament, sculpture and painting. The architecture of the past which best incorporated social utility and pleasure was that of Greece and Rome. The international style, which had revealed certain practical disadvantages due to the use of large areas of glass and the flat roofs was now deemed aesthetically unsuited for Soviet life and was abandoned.

This classic trend coincided with the popular taste, which had been shaped by the classical buildings of the Alexander period. From 1932 to 1937, new building was in the hands of Russian architects who had been trained in the academic tradition. Lenin's tomb, built before the second Five Year Plan by Stchousev, was one of the few Soviet creations which fused modern and traditional elements by means of the severe polished planes of native stone in black, red, and grey. The stations of the Moscow subway also made use of polychrome decoration but were conceived in a far more ornamental and elaborate style. The

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

classic column was again re-instated and the new buildings in Moscaw assumed an almost imperial and heavy classical style. If Soviet architecture like all the arts went backward to the sources of its inspiration, it went forward in its practical solutions of large scale collective enterprises. In its town-planning, its building of socialist cities like Autostroy and Magnitogorsk, its new forms of community living like the state farm and the collective, in its creation of new types of buildings like works clubs, rest-homes, communal restaurants, the boldest experiments have been made. New forms of social life have re-shaped a whole new conception of architecture, in which man and his physical and social environment in relation to each other are treated as the central theme. The war which put a stop to all large building projects and has destroyed much that was built in large areas of the country will necessitate a vast re-construction in the coming peace. —C.W.

**RUSSIA, RELIGIOUS PAINTING IN.** **Iconography.** The iconography of Christian art in Russia is to all intents and purposes based on the tradition of the Byzantine Church. Certain themes are particularly favored by the icon-makers, as, for example, the representation of the Trinity as the three angels at Abraham's table, which was only replaced by the conception of the subject as God the Father, the Son, and the Dove, with the coming of western European influence in the 18th cent. The types of the Madonna, developed in Byzantine art, were introduced at an early period; various versions of the theme became identified with the locality where the earliest or reputedly miraculous example of the type was preserved: one need mention only Our Lady of Vladimir and the Madonna of the Don, by Theophanes the Great. Paintings dedicated to the legend of the Madonna were ordered in a cycle of twenty-four stations, the **Akathistos** or Hymn to the Virgin, corresponding roughly to the rosary of Latin origin. In addition to the archangels and the great saints of the Byzantine calendar, a host of local Russian saints completed the iconographical repertory of the icon-painter.

The icons were revered and treasured as spiritual objects rather than as works of art. By a kind of fetishism, the Russian worshippers believed the images to be actually imbued with the very presence of the sacred personages represented. As in all traditional art, the effectiveness of the icons depended on the intensity of faith of the artist who created them and the people who venerated them with a zeal surpassing anything known in the Christian world.

*The Pre-Mongolian Schools of Painting.* Religious painting in Russia prior to the 18th cent. has been divided into the work of various local schools where this last of the Byzantine styles continued to flourish for centuries after the fall of the Eastern Empire in 1453. The beginning of Christian art in Russia goes back to that day in 989 when Prince Vladimir of Kiev established Christianity as the state religion. Although nothing survives from the period of the Holy Vladimir, the decorations of several churches from the 11th century have survived to the present day. These include the mosaics of Hagia Sophia in Kiev which represent a transference to Russia of the style of the Second Golden Age in Byzantium, as represented by the mosaics of Daphni and Hosios Loukas in Phocis. The Pantokrator is a kind of Antique Zeus, and the plastic treatment of the draped forms marks a return to the technique of classical painting. These mosaics in Hagia Sophia are obviously the work of Greek artists, imported under the Kievian dynasty. Another important work of this so-called pre-Mongolian period are the frescoes of secular scenes, mainly of gladiatorial combats, decorating the stairway of the Bishop's Palace in the church of Hagia Sophia, Novgorod. These are perhaps the sole surviving examples of a lost tradition of secular painting in Byzantine art. It is thought that this secular style with its emphasis on the intensity of dramatic presentation exercised an influence on the so-called Neo-Hellenistic art in both Byzantium and Russia. To this tradition belongs the great cycle of frescoes of the 12th cent. in St. Demetrius at Vladimir. These pictures have been dated 1196 to 1212, and are the Russian variant of a style represented by the mosaics of Kahrie Djami in Constantinople and the 12th cent. frescoes at Nerez in Bulgaria. The highly spiritualized heads are informed with a gravity and expressiveness that is quite new in the Byzantine tradition. Gestures and poses, meaningful in their explanation of the dramatic action, replace the old language of symbol and attribute. The colors, too, in a seeming revival of the Hellenistic technique,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

have taken on a new clarity and brilliance, and are slashed by highlights of a strident intensity. One of the most famous icons in the history of Russian art is the very much damaged panel of Our Lady of Vladimir which, legend has it, was brought by sea from Constantinople in the middle years of the 12th cent. This painting, which survived the Mongol sack of Vladimir and was brought to Moscow at the approach of Tamerlaine's hordes, has suffered much from subsequent restorations. No less than seven layers covered the original work. The iconography of the Madonna of Tenderness must almost certainly be associated with the emphasis on emotional values, characterizing the Neo-Hellenistic manner. Although the early layers of overpainting are in a dark rich tonality, typical of the pre-Mongolian school, originally the panel was painted in that illusionistic, sparkling technique that goes back to the Antique tradition. The figures have the simplicity and monumentality of the Byzantine mosaic tradition. Although legend assigns Our Lady of Vladimir to a Byzantine origin, there is a possibility that it is one of the first panel paintings by a Russian artist. The first of the Russian icon painters, the holy Alypios Petscherski, was active in the early 12th cent. His name is sometimes associated with this icon. In the wistful melancholy of expression, in the rhythmic elegance of the lines, there is already a suggestion of the later schools of Novgorod and Moscow. Our Lady of Vladimir, the very palladium of Russia, barely escaped destruction at the hands of the Mongols who in 1209 swept like a plague of fire across the plains of Holy Russia.

However great a debacle this invasion may have been for the economic and social development of the country, no reflections of this disaster are to be seen in the new school of Russian art at Novgorod, which had survived the wave of destruction, thanks to its isolation, and now became the cultural center of Russia. It was probably due to the great geographical isolation of Novgorod from Byzantium that its artists should have been the first to display an emancipation from the earlier, completely Greek styles.

*The School of Novgorod.* Such indirect Mongolian control as there had been of the city of Novgorod came to an end in 1259. An entry in the city chronicle of the year 1378 mentions for the first time the name of "Theophanes the Greek", with whose work there opens the greatest era of Russian painting. The most famous works by this master are the frescoes in the cathedral of the Transfiguration at Novgorod. The painting of the figures marks the final development of the Neo-Hellenistic manner. The brownish flesh tints are outlined with thick and freely painted black lines; violently slashed highlights stab the shadows and provide almost phosphorescent accents for the salient planes in masks that suggest at once the incandescent luminosity of El Greco and the haunting gravity of the Fayum portraits. Like Theotokopoulos the Greek in Spain, so Theophanes was the wonder of his contemporaries, and was styled "the Philosopher". Like El Greco, too, this master was one of the last to re-work the coloristic technique of the Antique world. Perhaps the nearest artistic equivalents to Theophanes' work in Byzantine art are the illusionistic frescoes of Mistra.

The panel painting of the School of Novgorod in the 14th and 15th cents. are the first to show a distinctly Russian style. They have a rarefied ethereal character; and the enormously attenuated forms are perhaps the most ghostly that any religious art has produced. An abstract rhythm of lines, in which the contours of figures and landscape are antiphonal one to another, is one of the most striking features of the style. The architecture is a collection of picturesque aediculae drawn from the artist's own imagination. The mountains are conceived as fantastic explosions of prismatic forms. The sparkling highlights represent a modification of the radical illusionistic formula employed by Theophanes the Greek. It has been conjectured that this national technique may have originated in the atelier of central Russia, even before the Mongol invasion.

*The School of Moscow.* Famous in the annals of Russian painting is the master Andrei Rublióv, who in 1405 collaborated with Theophanes in the Church of the Virgin Annunciate in Moscow. Nothing is known of Rublióv's training, and although he was associated with Theophanes, his manner is more closely related to the so-called idealistic style of the 14th cent. at Mistra than it is to the illusionistic technique exemplified by Theophanes. Formerly associated with the School of Novgorod, Rublióv is now believed to have been one of the founders of the School of Moscow.

The most famous single work by this master is the icon of the Holy Trinity, painted for the monastery of the Trinity and St. Sergius. This picture is the most notable

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Russian example of the symbolical representation of the Trinity in the form of the three angels who came mysteriously to Abraham's feast. The figures of Sarah and Abraham have been omitted, and our concentration is rivetted on the forms of the three ghostly personages. In many respects this is one of the first icons in a truly Russian style. The classic nobility of the heads and the masterfully draped bodies stem from the Byzantine tradition, but the forms are infused with a new and almost musically cadenced rhythm of line that is totally different from anything in later Greek painting. A new and tensile beauty sits on the proudly curving brows. This beautiful line is echoed in the curves of eyes and nose and mouth. The whole effectiveness of the arrangement rests largely on the wonderfully moving lines of the contours. There are subtle and indescribable rhythms between the angels with their great wings tentatively folded that make the whole composition a melodious accord of lines and silhouettes. It is this marvellous presentation of abstract ideas in moving linear terms that is perhaps the chief pictorial strength of Rublióv and his followers in the Moscow school. Adding to the feeling of unreality in these superb phantoms is a strange pictorial device of reversing completely the relative positions of dark and light areas in certain sections of the angel's draperies. Only a few traces of the illusionistic chiaroscuro of Theophanes survive. The colors, in their translucency and brilliance, suggest the work of the Italian masters of the 14th cent.

Not far from Novgorod, in a monastery founded by St. Cyril and the holy man Therapon, is preserved one of the great monuments of Russian wall-painting: the vast cycle of the Hymn to Mary, inscribed with the name of the icon painter Dionisij (Dionysios), and dated 1500 to 1501. Although the style of these frescoes recalls the 15th cent. icons of Novgorod, the painter Dionisij has been assigned to the School of Moscow. The sure and quiet contours of the forms and their rhythmic organization suggest the style of Rublióv. The figures are further distinguished by their suave feminine grace and elegance amounting almost to preciosity. The juxtaposition of colors—rose, pistachio green, and turquoise—against deep, azure backgrounds is strangely reminiscent of the Arena chapel at Padua. The figures have a distinct architectonic character and are set in severely simple compositions that make the paintings enormously effective as wall decorations. In this the developed style of the School of Moscow the sacred themes are presented in a style that is a fusion of the ideal Byzantine style and elements of a directness and naïveté that suggest an origin in Russian folk art.

In the course of the 14th cent. the art of icon-painting became a tradition separate from that of mural painting. This period is also marked by the development of the **iconostasis**, or icon-screen separating the church from the sanctuary. Such retables consisting of a single row of paintings had been used in earlier centuries, but the structure of the iconostasis now becomes a tall and wide screen with as many as five registers of painting, completely shutting off the altar from the body of the sanctuary. In the central row, or ***tschin***, the *Deesis*—Christ flanked by the Madonna and John the Baptist—occupies the place of honor above the door leading to the inner shrine. On either side of the *Deesis* are panels representing SS. Peter and Paul and SS. Michael and Gabriel. The portals leading to the holy of holies were decorated with paintings of the Annunciation and the four Evangelists. The upper rows of the iconostasis were given over to panels of various saints, paintings of the twelve feasts of the Christian year, and representations of the great Councils of the Orthodox Church. Although it is known that Justinian's great church in Constantinople had an altar-screen set with jewels and precious metals, the enormous screens of the churches of Moscow and Novgorod are a peculiarly Russian development. This typically Russian iconostasis appears at a moment when Russian painting for the first time begins to manifest a truly national character.

*The School of Moscow in the 16th century and the Stroganov School.* In the year 1534 the decline of Russian art began when Ivan the Terrible assumed the triple crown of Muscovy. With the sack and burning of Novgorod in 1570 Moscow in all its tawdry splendor became the capital of Russian art. Tsar Ivan undertook to make it another Rome in an architecture which combined the influences of the newly conquered Oriental provinces and of Renaissance Italy. In art there is an influence at once of western Europe and of the late Italo-Byzantine schools that had survived the fall of Constantinople. The 16th cent. icons of Moscow, although in a sense still based on earlier styles, displayed very certain and unhappy departures from the great tradition. The heavy and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

overladen shields of gold and silver with which the icons are all but concealed make the holy pictures appear more as objects for ecclesiastical pomp than for veneration. The compositions come to be crowded with all manner of fantastic and irrelevant details. The heads of the sacred personages are no longer ideal in their conception, but are realistic portrayals of Muscovite types. The ideal or rarefied style of the Novgorod school is replaced by a richly ornamented anecdotal manner of representation, marked by a delight in the multiplication of decorative and incidental features and exotic details in both figures and architectural setting. In place of the sensitive scale of vibrant colors used in the earlier schools these later icons are distinguished by their sooty, reddish brown tonality.

A certain group of icons of the 16th and early 17th cents. are attributed to the so-called Stroganov school, from the inscriptions on these holy pictures stating that they were made for the Stroganovs, a powerful family of Novgorod origin, particularly associated with the conquest of Siberia. The great period of the House of Stroganov, with which the florescent period of this icon school coincides, extends from the 16th cent. until the reign of Peter the Great. Members of the family, Maxim and Nikita Stroganov, were even active as icon-painters in the last decades of the 16th cent. Frequently the masters of the Stroganov school signed themselves "painter to the Tsar" or "painter of Moscow", in token of their activity in the capital. The style of Novgorod is again at the basis of the painters of the Stroganov school. A greater sharpness of contour drawing and an even more precise definition of detail differentiates these paintings from the work of the Moscow school. There is a tendency towards a miniature-like elaboration in an infinity of incidental detail that detracts largely from the monumentality the compositions might otherwise have. The color varies from an almost garish brilliance to a dull, metallic opacity. More often than not, the gold inscriptions, among the most distinguished examples of Russian chrysography, form a vital part of the composition. Although it is possible that certain icons of the Stroganov school show an influence in composition and types of Italian art of the 15th cent., their style seems in the main to be the final elaboration of the exhausted tradition of the great period of Russian art. It is to be noted, however, that certain details from the cycle of wall-paintings devoted to the Apocalypse in the church of St. Nicholas at Jaroslavl very clearly display an adaptation of Dürer's compositions for the Book of Revelations. Leaders in the Stroganov school were Istoma Savinus and his successors. These works have the same complexity of linear organization, the harsh metallic colors, and richness of ornamentation characteristic of this last phase of the icon-maker's art.

Although icons were mechanically copied from the great works of earlier periods until comparatively recent times, the great tradition of religious painting in Russia comes to an end in the late 17th cent. The work of the painters under Tsaral patronage from the time of Peter the Great until the end of the Romanov dynasty is distinguished by an unhappy and disagreeable effort to adapt the types and techniques of Baroque painting in Western Europe to the expression of the traditional themes. **sakura** (Jap.). The cherry blossom, symbolizing the soul of Japan; also the transient aspects of human life.

**Salian art.** The period of the Salian style parallels the epoch of the German emperors of the Salian Frankish House (1024-1137).

The peculiarities of the Salian style in painting and sculpture began with the school of Regensburg and were already established under the Ottonian King Henry II. Salian art favored the static, linear, and symmetrical elements of style and was inclined toward a one-sided metaphysical and ascetic expression. These tendencies stand in sympathetic relationship to Byzantine art from which it derived strong suggestions and influences.

There were two events of real importance in the field of architecture; the use of the vault for the first time in the rebuilding of the Cathedral of Speyer, and the spreading of the style of the Hirsau monks. About 1030 the largest building of the pre-Gothic period, the Cathedral of Speyer, was started. The newly introduced verticalism of the walls is to be noted. About 1100 the building was vaulted, under Henry IV. About 1100 they began to rebuild the Cathedral of Mainz,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

following the scheme of Speyer. The cloister church of Maria Laach shows the characteristic attributes of a building in the transition from the Salian to the Hohenstaufen period. About the end of the 11th cent. the style of the Hirsun monks spread over all Germany. The cloister church in Limburg a.d. Hardt and the rebuilt cloister church of Hersfeld may be considered as a preparation for this reformed style. The Hirsau style began with a thoroughly changed ground plan. As complicated as the groundplan is, the completed work appears simple and noble. Churches constructed in this style are, among others, the churches of Alpirsbach in the Black Forest (1095 to the first half of the 12th cent.), of Paulinzella (begun 1112), the Church of Our Lady in Halberstadt, and the cloister church in Maursmünster in Alsace (after the middle of the 12th century).

Salian standards of painting were established in Regensburg and later in Salzburg. The Sacramentar made at the order of Henry II (now in Munich) and the Evangeliar of the Abbess Uta from Niedermünster (now in Munich), both done under the last Ottonian emperor, already show the peculiarities of the Salian style. The mature style can be seen in the Evangeliar of Henry III (now in Upsala) done in the School of Echternach near Trier. The characteristic style of the period, which became very stiff, can be seen in the Evangeliar of Henry III (now in Krakau) and in the Evangeliar of the Abbey of Abdinghofen. The same stylistic peculiarities are in the contemporary murals of the choir of the former Benedictine abbey in Prüfening near Regensburg (1125-68) and of the west part of the Nonnberg abbey in Salzburg, about 1145. After 1100 a certain softening and loosening of style together with sentimental influences began to appear as for instance in the "liber florum" by Theofried of Echternach, done about 1100, now in Gotha, or in the Pericope of St. Erentrud in Salzburg, painted about the middle of the 12th century and now in Munich. The same softening appears in the murals in the choir of the chapel at Hocheppau near Bozen, belonging to the middle of the 12th cent. The highest achievement of Salian mural painting is the mural in the west building of the former abbey in Knechtstedten, about 1150.

In the field of sculpture the Salian style was already forecast by the antependium of Basle done under Henry II (now in the Cluny Museum in Paris). The various periods of development of the Salian epoch can be studied in the Virgin and Child of the Liebighaus in Frankfort, done in the 2nd quarter of the 11th cent., the bronze crucifix of the former abbey in Werden, the "Imad Madonna" in Paderborn (1051-1076), the burial plate of King Rudolf of Swabia in the Cathedral of Merseburg (after 1080), the tomb of a Westfalian duke (1100), called the Wittukind tomb in Enger, and the reliquary of St. Sigismund from the Welfenschatz, done in a Hildesheim workshop. To the same Salian period belong, among other works, the so-called Saint's Tomb Chapel in Gernrode, the bronze door on the south portal of the Cathedral in Gnesen, the wooden reading desk with the four Evangelists from Alpirsbach (now in Freudenstadt), the Externsteine near Detmold, 1115, the reliefs on the chancel arcades in Gustorf, 1130, and the "Madonna" from a reredos in the Cathedral of Erfurt about 1150.

Among works of applied art those to be noted are the crown of the German emperors, remade under Konrad II, the jewelry of the Empress Gisela, the Reichs Cross of Konrad II, and the portable altar done by Roger of Helmershausen, 1100, in the Hildesheim treasury. **salpinx.** See MUSICAL INSTRUMENTS.

**saltarello.** This Italian national dance is usually associated with the Rome district. It is danced by a couple to music in ¾ meter with an exaggerated accent of the first beat. Some of the steps are similar to those of the Tarantella with the exception that while the saltarello rhythm is uneven and skipping, that of the tarantella is even and running. The basic skipping step of the saltarello is varied at intervals by more elaborate footwork. —J.G.

**saltire.** See HERALDRY.

**samādhi mudrā** (Skr.). See dhyāna mudrā.

**samé** (Jap.). Skin of the ray, or of a shark, sometimes covering the wooden hilt of a sword.

**samisen.** See MUSICAL INSTRUMENTS.

**samai tsuzuki** (Jap.). See triptych.

**sanctuary** (*sanctus,* holy, sacred). (1) A holy or sacred place: especially a building or space devoted to sacred use. (2) Any structure devoted to worship.

**sanctus.** See Mass.

**sandal-wod.** Fragrant wood from Indo-Malaya, often the basic material for incense.

**sandarac.** This is little used now as a varnish material. It has been found to produce a very brittle surface film with a tendency to crazing. In ancient times it seems to have been more favorably thought of and, according to some writers, is supposed to have actually given rise to the name, varnish. Large quantities of it were exported from what is now Benghazi, then known as Berenice, and it is thought that the word, varnish, comes from a corruption of that. —G.L.S.

**Sanda yaki** (Jap.). Pottery made in Settsu province.

**sand blasting.** See GLASS AND GLASSMAKING.

**sand painting.** A form of expression of unknown origin, practiced by many Indian tribes but to an unrivalled degree in quality and complexity by the Navaho (q.v.). It constitutes one phase of a healing ritual and is made on the floor of a medicine lodge by young men under the direction of the medicine man or shaman. The paintings vary in size from 3 to 20 ft. in diameter. Sand is spread over the floor of the lodge to a depth of 1-3 in. and smoothed with a batten. The pigments consist of five colors of finely ground sand: white, red, yellow, black and a gray-blue, each used symbolically. Pollen and powdered corn meal are also used. The artist takes a pinch of sand with the thumb and fingers and allows it to trickle on the ground, forming a design in color on the neutral sand base. He works from the center outward and develops the design according to exact traditional rules, with opportunity for individual variations only in a few minor details. From one to a dozen artists, the number depending on the size and complexity of the design, may work upon one painting, for it is begun at dawn and finished before nightfall. The subject matter consists of highly conventionalized figures of the gods, the rainbow, lightning, mountains, clouds, animals and reptiles, all with a legendary significance. The patient is seated on the painting and pinches of sand from the painting are applied to the corresponding parts of his body, thus affecting the passage of the power of the god to the body of the ailing person. At the conclusion of the rites the shaman obliterates the picture, and the sand is removed from the lodge and thrown away. Reproductions are made from memory by white men who have been permitted to witness the rite, and are checked by sympathetic shamans. See Washington Matthews, *The Night Chant,* 1902; Laura Armer, *Sand Painting of the Navajo Indians,* 1931; Gladys Reichard and Franc J. Newcomb, *Shooting Chant; Sandpaintings of the Navaho,* 1937; Hasteen Klah, *Navajo Creation Myth,* 1942. —H.G.

**sandpaper painting and drawing.** A process of painting or drawing on sandpaper for reproduction. Usually a waxed crayon is used to build up an impression on the sandpaper which is then inked and printed. —R.L.W.

**sandstone.** A stone composed of grains of sand, united with other mineral substances, cemented together by a material of an argillaceous, calcareous, or siliceous nature.

**sang-de-boeuf** (Fr.). A red glaze on Oriental ceramics imitating the color of oxblood. See CERAMICS II.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**sanhaja architecture.** See ISLAMIC ART.

**san hsien.** See MUSICAL INSTRUMENTS.

**sanitary ware.** See CERAMICS I.

**sansui** (Jap.). Mountains and water; a type of landscape painting.

**santir.** See MUSICAL INSTRUMENTS.

**sanzon** (Jap.). In religious art, a trinity.

**sarabande.** The *sarabande* was an ancient dance thought to have originated with the Moors and been brought by them to Spain. Since it ultimately reached 16th cent. European courts, it is included in the list of *preclassic* dance forms. In its earliest Spanish days, the sarabande is reported to have been so wild and uninhibited that it was suppressed for a time by the moralists, to reappear in so sedate a form that it was used in religious drama. This stately and solemn dance in ¾ meter, having been adopted by the nobility, gave its name and form to the third movement of the instrumental suite. The movement of the court sarabande was limited to a slow walk by large groups of couples progressing in straight lines and large, sweeping curves. —J.G.

**sarangi.** See MUSICAL INSTRUMENTS.

**sarcophagus** (L.). A stone coffin, grave, or chest-like tomb. See EARLY CHRISTIAN ART; ALEXANDER THE GREAT, SARCOPHAGUS OF.

**sari** (Hind.). An East Indian woman's garment. A long narrow cloth wrapped around the waist covering the legs as a skirt, passing over the bosom and sometimes covering the head. See cotton. —J.A.M.

**sarinda.** See MUSICAL INSTRUMENTS.

**sarsenet, sarcenet.** An antique fabric of plain silk weave.

**Sasanian, Sassanian art.** See ISLAMIC ART; PERSIAN ART.

**satellite city, town or suburb.** See CIVIC PLANNING.

**satin.** A fabric with a glossy surface and a dull back; also the weave by which this fabric is achieved. Satin weave throws filling threads to the surface. See weaving.

**Satsuma yaki** (Jap.). A type of pottery from Satsuma province. The most widely known has a creamy crackled glaze and is decorated with an elaborate minute pattern of figures, inserts, geometric designs, etc. —J.A.M.

**saturation.** See COLOR.

**Saturn.** Ancient god of seed sowing.

**Sauroktonos** (Gr. from *sauros* + *kteino*). The Lizard slayer. Sobriquet given to a statue by Praxiteles. The original was of bronze and originated about 350-325 b.c. It is listed among the works described in Pliny's "Natural History" XXXIV, 70. There are, among others, Roman copies in marble in the Vatican and the Louvre, and a small bronze replica in the Villa Albani in Rome. All these statues represent the young Apollo as he watches a lizard creeping up a tree. He holds an arrow and evidently waits for the moment to kill the lizard. For illustration, see Gisela M. A. Richter, *The Sculpture and Sculptors of the Greeks*, New Haven, 1929, Fig. 674 and 675. —L.L.

**savonarola chair.** See FURNITURE.

**savonnerie.** One of the most sumptuous and formal rugs in the world, was developed and perfected in a discarded soap factory in a district which is now part of Paris. "Savon" being French for soap, the rugs made there were called "savonnerie" (soap factory) rugs. Savonnerie means to us a most elegant and aristocratic floor covering of deep rich pile, woven by hand, in France. The technique is about the same as had been in use in the Orient. The loom is strung with warp threads and the pile is formed by tying in separate knots of worsted, making a row of knots or tufts across the entire width of the warp. Then two or three weft threads are woven in to bend in the knots and form the fabric before the succeeding row of knots is tied. —B.E.J.

**sawing-in, sawn-in.** *Book.* When the cords or tapes are placed in grooves sawn in the back of the book. The sawing machine is the machine doing the work. In handwork it is usual to use a tenon saw.

**saxhorn.** See MUSICAL INSTRUMENTS.

**Saxony, Saxon wool.** (1) Fine, soft, wool having a short, very fine, strong and elastic staple, with excellent felting properties. (2) A worsted fabric originated in England.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**saxophone.** See MUSICAL INSTRUMENTS.

**saya** (Jap.). Sword scabbard.

**sayydi.** See ISLAMIC ART.

**scabbard.** Sheath for sword or dagger. See saya.

**scabble.** As used in masonry: To dress or shape roughly, as a stone.

**scale pattern.** In ancient Mesopotamian and Greek art, an ornamental pattern in which rows of pointed or round tipped scales overlap and are arranged so that the tips of one row come over the joints of the lower row. —L.T.S.

**scales and modes.** A *scale* is an abstract of certain pitch interval relations. With reference to primitive or folk music or even to Gregorian chant, the abstract takes into consideration all the tones of a composition, independent, however, of the specific sequence, number, rhythm, or pitch height in which they occur. The relevance of a scale to more complex music is, on the other hand, as a representation, in the same abstract way, of only some of the tones—those which are, in a sense, more basic or elementary to the structure.

The formulators of such an abstract assume an identity between a tone and its octave above or below, or two octaves above or below, and so forth. This identity is illustrated when men and women sing the same tune, thinking they are singing in unison. Each tone in the scale, although represented once, is available in various octaves of the pitch continuum.

The apprehension of a scale pattern as basic to a conglomerate of tones exceeding that pattern, was facilitated by the establishment of the **diatonic system** as a European standard for scales in the last part of the period of Greek music. Such scales embodied intrinsic affinity among their constituents, so that other tones could be immediately recognized as not belonging to the basic group. It was not, however, until recent centuries that these possibilities were appreciably realized.

Diatonic scales assume several different forms which are known as their **modes.** Since the 18th cent., a favoritism for the **major mode** has made itself evident. But this mode was not ignored by the Church composers as it is generally thought. Thus, what was theoretically the **Lydian mode** (the white keys on the piano from F to F) was in practice the major, as a result of the constant improvised interpolation of the B-flat as so-called *musica ficta.* Major manifested itself in *musica ficta,* moreover, in still other ways (see below).

Ancient music provides a great many types of scales upon which it is difficult to generalize and whose authenticity is often doubtful because of the inadequacy of records. The results of comparative musicology show, however, a prominence of the pitch intervals of the fourth and fifth. The transition to the diatonic system seems to have been a broadening of the role of those intervals. The result was the achievement, after a long period of trial and error, of a set of scales whose plasticity was so great that it was considered unnecessary to seek further. It would seem justified, then, that space be devoted here to these later scales and to a determination of the factors which contribute to their preferred position. In the course of this approach a natural basis for one of the most prominent of the primitive scales—the **pentatonic**—will be provided, since this was probably a link to diatonism.

There are said abstractly to be twelve tones in the present musical system. Each is concretely available in about eight different forms—that is to say, at eight degrees of pitch height or depth. With the exception of certain contemporaries among whom Schönberg is outstanding, composers have found it expedient to select some of the twelve tones as a basic recurrent pattern, against which the other tones are made to stand out as deviation. Thus, musical composition is based on a number of recurrent patterns along the various dimensions of tone (pitch, duration, loudness, timbre). These patterns are unfolded simultaneously and they allow of deviation which may or may not occur coincidentally along the various dimensions.

The capacity of tones to group themselves in the so-called diatonic manner is determined by their intrinsic affinities. It was seen that tones at the octave have a certain identity. Now tones at the fifth bear similarity to one another to such an extent that the musically undiscriminating sometimes sing in fifths, thinking that they are singing the same thing. Musical theory, moreover, since the time of the Greeks, bears witness to the fact that occidental musicians have always recognized the fifth as embodying the highest degree of unity or **consonance** possible in the combination of two tones unless the two tones be related by means of the octave identity. Stumpf's

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

psychological experiments in which two pure tones at the interval of a fifth were often mistaken to be one tone, may also be cited. Many more illustrations of the peculiar unity of the fifth could be given but for the limit of space. It should be noted, however, that the oft-cited numerical ratio 2:3 of the vibrational frequencies by which tones at the fifth are generated, is not so much a proof of what is heard, as much as it is a verification.

There is not only an immediately recognizable simplicity in the relationship of the tones of a fifth, analogous to the simplicity of the right angle as compared with other angles, but there is also a direction in the relationship. The lower tone of the fifth is **fundamental** to the upper tone. This is demonstrated by the instability of the fourth, in which the two tones are inverted, so that the heavier or fundamental tone seems top-heavy appearing as it does in the higher or less dense pitch position.

It is possible to arrange the twelve available tones in a series so that their affinity to one another with respect to the unity of the fifth can be demonstrated, and in this affinity will be found a justification for diatonic scales and modes. Certain points relative to this series must be stressed in advance. It is not a historically accurate representation of how the modes were derived, but seeks rather to elucidate intrinsic relations which, directly intuited, may have guided composers in their choice. It must be understood, moreover, that this series is being constructed regardless of the exact octave position of a tone. Of the tones C and F, either one may be on top, and each may be in any of the eight possible octave ranges of the pitch continuum. The significant factor for the series is that F is fundamental to C.

Any tone may be taken as a starting point, for example, F. The series is circular, that is to say, comes back upon itself: thus, F-C-G-D-A-E-B-F#-C#-G#-D#-A#-E#, etc. For the present E# is identical with F; A# with B-flat, etc. For convenience, the tones should be imagined as arranged in a circle like the numbers of a clock. F and its counterpart E# will occupy the position of 12; C the position of 1; A#, the position of 11; B, the position of 6; etc.

If F is fundamental to C, and C is fundamental to G, then through C, G can be subordinated to F. The ear actually hears G come to rest on F, in the manner that a given element may be expected to rest upon something which is basic or fundamental to it. It may be objected that F may be subordinated to D# (E-flat) through A# (B-flat), and then to G# (A-flat), and finally, through the intervention of nine tones in the series, may be subordinated to G, from the direction of D. It is obvious however, that a closer connection may be established through G. It still remains that F, so to speak, is more fundamental to G than G is to F. The same is true of the relation of D, A, and E, severally, to F. A difficulty arises with the diametrically opposed tone, B, which is as fundamental to F as F is to B, because it takes the same number of steps to subordinate F to B as to subordinate B to F.

The tones from F to B comprise a **diatonic scale.** Any group of seven tones which lie in an unbroken series along the circle will likewise be the same relationship, and must therefore comprise a diatonic scale in a different vicinity of the circle, or, as it is commonly said, in a different key. It is obvious that there are natural co-ordinates or natural boundaries to mark off the group of tones which comprise a scale. Tones diametrically opposite mark a difference point, because two tones in this position are the only ones which introduce an ambiguity with reference to the direction of the relation.

With F as a starting point, until B was introduced, all the tones tended to subordinate themselves directly to the first tone. If any of the tones on the right side of the circle are given with or prior to B and F, the means for subordinating the former to the latter will be provided. But B will always cast a doubt upon, and thus weaken, F. As a result, the interval F-B lacks equilibrium or center of gravity, technically known as a **fundamental.** Thus, the interval has a strong tendency to lean for support on the tones in its immediate vicinity. Within the given group of a semi-circle, these tones are C and E which are, moreover, the closest in the diatonic community whether the community is viewed in the abstract arrangement in the series of fifths, or in the concrete arrangement in the pitch continuum in which E is just below F and C just above B. Thus, B and F, by contracting or leaning upon the inner tones of the semi-circle, tend to hold them intact as an elastic binds a group of objects together.

C is the next highest to F in the hierarchy of tones arranged in a series of fifths from F as a starting point. Thus, C profits by F's inability to subordinate all the tones. C takes over, being next in the hierarchy.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The way in which the second tone of a semi-circle subordinates all the tones of the diatonic group, reflects in *minutia* the way in which composers ordinarily unify all the tones of a composition with respect to one central tone. Thus, not only a group of tones is taken as a recurrent pattern, but one tone within the group is emphasized above the others as a recurrent element. The tone thus stressed is called a **tonic.** After the tonic has been established, stress of another tone, with or without change of the diatonic group of tones, is felt obviously as a change of place.

The composer is not at all times obliged to use the intrinsic tonic (for example, C in the semi-circle under consideration). For sometimes he might desire the conflict of exalting the tone which is not intrinsically the principal tone, just as the poet may end a line with a word that is not, in the sense of meaning, the final word of a thought. Thus, a line pause may be slightly acknowledged in reading, but the voice is not dropped, so that there is comparatively little rest in this pause. Likewise, an intrinsic tonic may be recognized in its special quality as a certain point of rest and emphasis though the composer has not stopped dead upon it. What matters most is the composer's awareness of the conflict and thus of the intrinsic affinity of tones. But awareness of the affinity does not mean constant procedure *in accordance* with the intrinsic direction.

When a composer's tonic coincides with the intrinsic tonic, he is said to be using the Major mode. The use of the word major reflects the conviction of composers that this is the more unified arrangement of tones. The conviction is likewise reflected in the more frequent use of major in contrast to the other modes during more recent centuries.

When the tonic is decided, a scale is commonly represented in analysis by a series of tones rising gradually in pitch from the tonic to the octave above the tonic, for example, C-D-E-F-G-A-B-C. Any part of the concrete musical composition in which tones of the scale move in this gradual, simple pitch movement, as in the abstract (that is, mainly in whole and half steps), is said to move in **scale-wise motion.** It is curious that G and F which are nearest to C in the structural arrangement of the tones of the key in the series of fifths, are farthest from C in the reduction of the tones to a single octave range. Moreover, B and C, or F and E, which are almost the farthest apart in the circle, are closest in pitch. The ratios, however, are not completely reversed, because B and F, farthest apart on the circle, are not closest in pitch.

The use of modes other than major involves the choice of a less authoritative tonic. Thus, the **minor mode** takes as its tonic, or point of greater emphasis, the tone that stands in the relation of A to the key of C major—that is, the fifth tone down from the top (F) in its semi-circle. Its remoteness from the more final or fundamental tones is a measure of its lesser authority and consequent availability for moods in which affirmation is not the chief characteristic. Of the old **ecclesiastic modes** which some modern music revives, the **Lydian** would take F as its tonic (the characteristics of which have already been observed); the **Mixolydian,** G; the **Dorian,** D; and the **Phrygian,** E. It is significant, that the modes other than major have manifested a growing tendency to borrow from major mode ever since the greater complexity of music demanded a greater unity. Thus, the choice of modes other than major may have been determined in the period of Church polyphony, by the demands of a solemn text and a humility which regarded man presumptuous to assume the definiteness and finality of the major mode. Yet at certain points where definiteness and finality were required in *minutiae* for the sake of the form, namely, at cadences, it was customary for performers to interpolate (according to the practice known as musica ficta) the leading tone and major chord third (*tierce de picardie*) borrowed from the major. Unity was thus strengthened by showing, at certain prominent points, the subordination of the tones of a composition to more fundamental tones, with means eminently furnished by the major mode. This practice survives in the minor mode of later music where the borrowings are no longer improvised and are much more numerous. The **melodic tetrachord,** borrowed from the major, is almost inevitably used in approaching the minor tonic, so that the latter may have some of the authority of the major tonic. In Bach and Mozart, moreover, the *tierce de picardie* quite characteristically offers final major resolution to a work that has started in minor.

Just as Mozart was (perhaps only intuitively) aware of the tendency of the major tonic towards its subdominant, so Stravinsky today, reviving the ecclesiastic modes, senses their tendency towards the more authoritative major. He senses this tendency not as the ecclesiasts did, vague groping towards major,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

but as one who may retrospectively profit from a period of remarkable exploration of the potencies of this mode. The *Symphonie de Psaumes* commences with phrygian, Stravinsky's favorite among the older modes. It ends on a C major chord. Thus, E phrygian offers a rather bleak arrangement of the same tones with respect to C, however, places in relief the tones towards which the diatonic group tends. This tendency of E phrygian towards C is, moreover, felt throughout the first movement.

In the light of the circle of fifths, the primitive **pentatonic scale**, which is still encountered in folk music and many jazz melodies, is merely a shorter series of tones than the series which comprises a diatonic scale. Instead of moving seven tones along the circle, it stops at the fifth tone, thus: F-C-G-D-A. The same affinity of tones is provided, but there is no tritone F-B to mark the boundaries of the set of relations in a way that was found above to suggest the action of a rubber band. It is, therefore, easy to understand why there were so many pentatonic Gregorian melodies though the full diatonic scale seems to have been known; and why even when the diatonic scale was used, the extremity tones were admitted sparingly, so that the pentatonic basis sounds forth. The Church composers were intuitively confining themselves to the simpler elements of the diatonic scale and were avoiding the ambiguity of the diametrically opposite tones.

There have been numerous attempts to expand the barriers of diatonism by increased attention to the tones not directly a part of the basic pattern. This practice, which passes under the name of **chromaticism**, was observable around 1600, notably, in such composers as Gesualdo and Monteverdi. In the works of such later composers as the Scarlattis, the Bachs, Mozart and Haydn, this chromatic expansion was absorbed into a new diatonism rehabilitated by the increased possibilities of the major mode. This mode provided a higher degree of unity strong enough to control the more daring chromatic deviations. A more vigorous chromatic expansion has taken place since the middle of the 19th cent., as part of the romantic drive to break down all limitations. The increased attention to the deviation from the scale patterns has finally led to the acceptance of the deviation, paradoxically, as a norm. Thus, in Schönberg's system there is no longer a selection of tones, but all twelve tones constitute the so-called **duodecuple** scale. A transition is discernible in Debussy who is commonly said to have contributed a **whole-tone scale** which one may construct by taking every alternate key on the keyboard (black as well as white) or every alternate member of the above circle of fifths. It is purely a matter of terminology whether Debussy's predilection for movement in whole-tones is to be dignified with the rubric "scale" or not. Such works as the piano prelude, *Voiles*, in which there is only the briefest deviation from adherence to a single whole-tone scale, are, to be sure, exceptional. For the rest, there is merely a feeling of some diatonic basis, at least in the formulation of many of the chords. As in Wagner, there is frequent shift of the diatonic scale from one chord to the next. Also, there is even greater preference than in Wagner for chords which straddle diatonic scales (such as the opening chord of *Tristan*) and which thereby tend towards a whole-tone pattern.

The **twelve-tone scale** is, in a sense, a return to the concept of primitive scales as an abstract of all the available tones. It is a negation of the later European concept of the scale as a selection of tones. In more than one sense it is a negation, for twelve-tone music, while presumably encouraging the freedom of tones, distributes tones in such a way that they will avoid any accidental reference to the older concept of restriction to a diatonic scale. The twelve-tone system is more than a scale, it is a method of composition, and thus exceeds present boundaries. Twelve-tone music by its deliberate avoidance of diatonic principles, presumably sacrifices the possibilities of unity observed above in diatonic scales. Twelve-tone adherents, however, attempt to justify themselves by maintaining a genetic theory as to an acquired perception of unity in frequently associated tones. The intrinsic unity which is recognized as existing among certain tones by those who seek to revive diatonic principles today, is regarded as an illusion, and habit is substituted as a criterion of such unity. At other times the lack of this unity in the twelve-tone scale is admitted, but the unity of motive development is said to compensate for the lack (see TWELVE-TONE TECHNIQUE). **SCANDINAVIAN ART** in all its manifestations is singularly indigenous to the North. The virile intensity of Norwegian painting, for example, is the expression of man whose pulse beats as one with Norway's dramatically compelling nature; the note of mystic lyricism that transcends its formal plastic qualities is the communication of painter closely akin to the mood-variegated environment of scintillating septentrional light, of constraining boreal darkness. What is less generally understood, however, is that northern art both fine and applied has not been isolated from the notable historic periods and school isms of continental Europe but has followed these closely through cultural and commercial relations and electically shared and natively absorbed the familiar characteristics both good and bad. Furthermore, there is a third fundamental factor that must be primarily considered. That is that nowhere has the technology of the power age been more widely accepted and skillfully utilized than in Scandinavia. This, combined with the universal literacy, the far-reaching adult education programs and the pioneer advancement in economic reforms and social cooperation that has distinguished 20th cent. Scandinavia, has made for a highly progressive homogeneous society which is unique in its wide appreciation and developed achievement of art for the masses as evidenced in the dynamic art-in-industry movement, in the quality of public housing and the democratic state sponsorship and support of all creative talent.

*Norse Art from Viking Age to Nineteenth Century.* Though little is recorded of Norwegian history prior to 800 A.D., archeological studies made from graves and antiquities preserved from the Stone, Bronze, and Older Iron Age reveal that tools, weapons, ornaments, vessels, and utensils had already a beauty of form and a taste in ornamentation truly admirable. However, it was during the illustrious Viking Age, from the end of the 8th cent. to the middle of the 11th, that the foundations of Norwegian applied art were firmly laid. The Vikings had an intense interest in handicrafts and were pre-eminent in the decoration of their arms and domestic utensils. In that era the higher classes of Norway dwelt on country estates where men spent much of their time at metalwork, woodcarving, and the making of weapons while the women were devoted to needlework and the weaving of tapestries of colored wool as well as fine linens.

Unearthed in southern Norway in 1904, the 9th cent. *Oseberg* viking ship with its decoratively carved prow and contents is one revealing example of the technical ability, the artistic talent and the feeling for his material evidenced by the craftsman of the period. The University Collection of Antiquities in Oslo likewise testifies to the sensitive feeling these early Norwegians had for fashioning their every-day objects so that they were functionally and aesthetically satisfying. Further illustrating the ancient culture of the country is the *Norsk Folkemuseum* in the outskirts of Oslo (here, for example, is *Raulandsstuen,* the oldest dwelling house in the country, a chieftain's hall from about 1200) and the outdoor museum, *Maihaugen,* at Lillehammer, where have been re-erected, still housing their hand-fashioned interior furnishings, all types of early dwellings from many parts of Norway, humble crofters' huts and elaborate ancestral estates alike.

Moreover, in most towns and rural districts throughout Norway are similar museums, usually the open-air type where one can study the past cultural development of regional Norway. The period dwellings which have been thus reestablished from their original site to a similar one in the outdoor setting of natural landscape which is the museum grounds, make possible a first-hand study of art expression from the Viking era through the Middle Ages and so up to recent times. The aged buildings are characteristically of timber and it is apparent that the owner often carved the portal even as he did the furniture, wall cupboards and other fittings, or, frequently, by floral brushwork, *rosemaling,* adorned walls, ceilings, furnishings, and utensils such as the wooden bowls and drinking vessels which he had so beautifully shaped. There is likewise wide evidence of the weaving of decorative textiles which found such fertile origin in the Middle Ages. Outstanding are the figured tapestries of wool, in rich earth colors, characteristic of Eastern Norway valleys and the *Aaklae* weaving

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

(wall hangings) of the West Coast with colors heraldic and patterns based on the check. Embroidery is conspicuous as a popular textile art from the 12th cent. on. It will be further noted that silversmithing in the form of bridal crowns, belts, buckles, brooches of gothic influence, and exquisite filagree jewelry romanesque in character also prospered. It is of great significance to present-day creative Norway that this many-sided inspirational material is not only to be found in the generous museum collections throughout the land but that almost every dwelling place over the countryside has at least some pieces which have come down from these rich ages past, used in the family generation upon generation.

Divided into various sections by mountains and valleys with nature favoring each section in a different way, Norwegian applied art became regional in character. This regional development of folk handicraft reached its height from 1750 to 1850. For example, around Stavanger, where there was much wool, weaving was paramount while in the forested Budbrandsdal and Telemark the art of woodcarving, with the baroque vine serving as leading motif, reached masterly heights. This popular art expression was supplemented, at the same time, by the guild-directed crafts of the towns which flourished not only in the Middle Ages (when the church took the lead in decorative art, e.g., carved chairs) but through the baroque, rococo and classic periods, the most important production being the gold and silversmiths' art. Conspicuous also in the Norwegian art industry of the 17th and 18th cents. were the richly decorated stoves which, made by the iron works, were notable for the linear beauty expressed in their relief. The cabinet-maker's art was likewise well established. In the latter 18th cent. a distinguished faience also flourished for a short period. Furthermore, in 1744 an eminent glass works was founded whose artistic traditions have continued into the current modern production. In close touch with the evolution of style in Europe proper, a national Norwegian decorative art developed along the lines indicated in high degree of achievement until 19th cent. industrialism destroyed the age-old organic pattern of native Norse creativity and temporarily gave rise to an era of confusion and poor taste.

Closely related to the development in Norway was that of the Swedish and Danish applied arts The arrowheads and implements of the Bone Age, monumental graves, dolmens and cists of the Neolithic Age, rock engravings of the Stone Age, geometric ornaments in the Bronze Age and the characteristic Norse interlaced animal forms introduced in the Iron Age proclaim Sweden's 8000 years of prolific creativity. Already by the 7th cent. ornamental style was distinctive in the magnificent compositional use of the awesome animal forms as evidenced, for example, in a chieftain's helmet of iron and guilded bronze found in one of the Uppland mountains. The elegance of this style and great skill of craftsmanship reached unsurpassed heights with the Viking Age. Along with the arms, weapons and ornaments of exquisite conception and workmanship that the vast mounds about the Swedish countryside reveal are the rune stones, these standing above the ground, impressive and monumental, their inscriptions and highly simplified but virile decorative features incised to the memory of martial feats and peaceful pursuits alike. Again the interlaced animal forms enclosing motives of many kinds, which have since come to the symbolic of the Viking epoch, are typically employed.

With the advent of Christianity which was more or less established in Sweden by 1000 A.D., foreign influences became more and more apparent though the traditions of national art were often incidentally taken into the new forms of Christendom. Thus the adornment of the first churches in metal-work and textiles was still of Viking Age character and this transmission continued far into the Middle Ages. Medieval art in Sweden was, in fact, largely ecclesiastical but even as this bore characteristics of the Swedish popular tradition so, in turn, did the religious production inspire and influence the home creativity which persisted in its evolution of a distinctive people's art. This development of a native tradition continued, in fact, until the Industrial Revolution having survived meanwhile the Renaissance period when art entered into the service of the Swedish lords who imported their artists and craftsmen (German and Flemish ones in particular) as they did also through the 17th cent., the period of Sweden's wide political ascendency, and the brilliant French-inspired 18th which brought first a strong rococo influence, then the Louis XVI styles (in its Swedish form called Gustavian) and later the neo-classic. *Nordiska Museet* (1872), the central institute of Swedish cultural history, and its open-air section, Skansen, also founded (1891) by

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Dr. Arthur Hazelius, originator of the open-air type of museum) as well as some 400 regional museums over Sweden reveal how the popular art took unto itself forms and colors from the style epochs of the higher classes, absorbed and repeated these in original variations through generations, as, the animal motifs of the Viking period, the Romanic scroll, the late Renaissance baluster and interlaced ornament. Furthermore, these variations of the same national or international motive or technique had independent modifications in one Swedish province from another and the local traditions, particularly in the textile art, became strong and independent in their own right. To be noted also is the judicious use of native materials: wood in the form-expressive and decorative utensils, drinking vessels, chests and furniture fixtures such as the cupboards, beds and benches which were often built to the walls; iron in the ornamental locks, hinges and chest bindings, in vanes and crosses; linen for textiles, and wool for the woven hangings and covers used on festive occasions. Painted wall-hangings sometimes supplemented the latter. Usually in the form of horizontal borders these were highly decorative in character with natively conceived, beautifully patterned biblical scenes as well as portrayals of daily life. The 18th and 19th cents. found local masters in the southern provinces of Smaland, Halland and Dalarna particularly adept at this art.

The cognate relationship of Denmark's development in the Scandinavian pattern is best evidenced in the Danish Collection of The National Museum in Copenhagen which includes also the Danish Folk Museum and the Open-Air Museum in Lyngby. This vivid revelation of the cultural unfoldment in Denmark through the ages is further illustrated in the art and craftsmanship of the collections in *Det National Historiske Museum Paa Frederiksborg,* a notable castle adapted as a public museum of Danish natural history. The Old Town in Aarhus, Jutland, is a unique departure in the famed Scandinavian outdoor museum technique in that here, in a town scientifically re-erected, is reproduced the background of Danish urban life before the coming of industrialization. The large burgomaster's house, for example, with rooms in the many different styles developed during its years of occupancy reflects Denmark's close cultural contact with greater Europe. From a room Renaissance in character, to others rococo and baroque, one meets finally the Empire and early Victorian influence. More formally Copenhagen's *Kunstindustrimuseet,* typical of Scandinavia's important Museums of Applied Arts, displays the whole development of Danish applied art.

*Painting in Norway.* When in 1814 Norway became a more politically independent state by its separation from Denmark, artistic life had a blossoming and Norwegian painting its inception. The first movement was a vigorous national one with J. C. Dahl (1788-1847) masterfully leading the way in Norwegian landscape composition monumentally conceived while A. Tidemand (1814-1879) and Hans Gude (1825-1903) depicted the popular life amid the imposing Norwegian nature. It was to Düsseldorf that these painters and their followers travelled to study and work. In the 70's, however, Munich became the center of Norway's painters and, the challenge of vigorous new forces being recognized in French painting, romanticism here gave way to naturalism. Stimulated thereby, a group of gifted artists returned and solidly established painting in their native Norway. Notable among these was Christian Krohg (1852-1925), a key figure in the new concern in social questions, a strong colorist and figure painter. Another colorist, eminent for her interior studies with their sensitive handling of light, was Harriet Backer (1845-1932). It was, however, with Erik Werenskiold (1855- ) that art in Norway became autonomous and organized (about 1880). Extraordinary interpreter of the Norwegian national character, Werenskiolds' gifts are uniquely manifest in the black and white illustrations for the Norwegian Fairytales and the Sagas of the Norse Kings by Snorre Sturlason, Norway's two national literary monuments. His portraits, furthermore, are among the outstanding Norwegian paintings. Another member of this galaxy and further exponent of a national revival was Gerhard Munthe (1849-1928) an excellent landscape painter but of greatest importance for his lasting influence on modern Norwegian applied art through his highly decorative compositions for which he used old Norse saga and tale as source material. Following upon the realism of the eighties was coming in fact a brief period of neo-romanticism. Its import for later developments lay in the experimented treatment of light in landscape. On the one hand were the lyricists Halfdan Egedius (1877-1899) with idyllic canvases of vibrating delicacy and Harald Sohlberg (1869- ) whose landscapes are individualized by an

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

enamel-like glow. The painting of Thorvald Erichsen (1869- ) and Oluf Wold-Torne (1867-1919) on the other hand, reach eventually beyond their own group of the 90's who received technical training under Zahrtmann in Denmark and cultural expansion in Italy, and develop an advanced sense of color and form through the influence of Cezanne. While Torne came to be identified more with Norway's national movement in the decorative arts, Erichsen is celebrated for his final freeing of Norwegian art from narrative concern to an emphasis on formal design considerations, leading the way thereby to general cognizance of the great creative genius Edvard Munch (1863-1944).

Pioneer Expressionist, Munch's influence has been internationally revolutionary, his famous controversial exhibition in Berlin in 1892 causing the schism of *Berliner Künstlerverein* which led to the foundations of the *Berliner Sezession.* Munch's dynamic art likewise marks a radical change of direction in Norwegian painting with emphasis no longer on realism and illusionism but powerfully expressed individual interpretation. At once lyrical and violent, Munch has portrayed with most sentient perspicacity the profoundness of the modern psyche. His paintings are impressive in their masterly synthesis of coloristic construction, vigorous pattern and spirited intensity of execution. In his murals for the auditorium of the University of Oslo is evident also his ability to most sensitively express the Northern feeling tone and character. In the medium of graphic arts, Munch has been further prolific. Among the painters in whose work the influence of Munch began to be discernible were Ludvig Karsten (1876-1926), of outstanding coloristic talent, and Henrik Lund (1879-1935), noted for his portrait compositions and, like Karsten, for marked technical affluency. A. C. Svarstad (1869- ) and Nicolay Astrup (1880-1928) are looked to as able colorist interpreters of urban and West Norway respectively. Arne Kavli, Bernhard Folkestad, Sören Onsager, and Torstein Torsteinson are other prominent painters of the generation characterized by a deep feeling for and a distinctive handling of color.

A galaxy of contemporary Norwegian painters has been coming to international attention in recent years. Schooled in the 1910's under Henri Matisse in Paris, they received stimulus towards simplification in style and constructive composition which considerations they later saliently incorporated into their endeavors to transcribe the pictorial possibilities of the most intimate contact with Norwegian nature. Under the leadership of Henrik Sörensen (1882- ) they have developed a unique sense of the monumental which has taken form in huge mural decorations painted al fresco in the public buildings of Norway. Pioneers in this field are Axel Revold (1887- ), Per Krogh (1889- ), and Alf Rolfsen (1895- ). Typical frescos are the ones in the Bergen Stock Exchange by Revold, those in the Oslo Navigation College by Krogh, Rolfsen's commissions for the Artisan's Auditorium and the Oslo Crematorium, and Sörensen's work in the Cathedral of Linköping, Sweden. These painters were engaged in mural decoration of Oslo's new Town Hall at the time of Norway's entry into World War II, Sörensen's fresco being the largest in Norway to date, twelve meters high and twenty-four wide. Furthermore the talents of these prominent artists had been earlier recruited in the execution of decorations for the 1937--built liner Oslofjord. Closely associated with this group is Hugo Lous Mohr, Jean Heiberg, Rudolf Thygesen, and Per Deberitz. A still younger generation, whose initial training at the State's Art Academy in Oslo (where Revold and Heiberg are professors) has been supplemented with study in Paris, have experimented in turn with the *Neue Sachlichkeit* (q.v.), cubistic abstraction and social studies. Among those who have already distinguished themselves nationally with original talents are Henrik Finne, Aage Storstein, Willi Midelfart, and Reidar Aulie. Characteristic tendencies are the use of richer color towards striking pattern and bold decorative values and a more simplified handling of form and color in landscape organization.

Supplementing the larger museums are *Kunstforeninger* in fifteen Norwegian towns which arrange excellent circulating exhibits of contemporary art, changing their local displays every two weeks. In the State's annual art exhibition held in Oslo since 1883 and open to the whole nation for participation, the new talent discovered in the fields of painting, sculpture and the graphic arts is awarded by fellowship to the State's Art Academy. Norway's recognized artists are also financially assisted by an appanage from the State treasury appropriated by the *Storting* (since 1863) on recommendation of the Department of Education. Furthermore, since 1888 the Norwegian government has recognized a committee elected by painters and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sculptors consisting of seven members (at least four painters and two sculptors) as an administrative committee for state exhibitions of art and as adviser to the government in questions of art. All commissions for the decoration of public buildings and works are awarded on the basis of national open competitions sponsored by the State. The leading artists are also widely engaged on such democratic projects as illustrating the Norse fairy tales and public school readers, as in the new 1939 editions of these books, in an effort to bring the nation's best art into the widest application possible.

*Sculpture in Norway.* Following the Viking period of high plastic attainment in wood, the sculptural creativity evidenced in the richly carved Romanesque timber churches and the restrained but sensitively expressive crucifixes, heads and masks of 13th cent. Norwegian Gothic (notably in Trondheim Cathedral), sculpture in Norway fell into almost total eclipse until the 20th cent. brought conditions more favorable for nourishing this art. The name of Stephan Sinding (1846-1923) marks the first turn from the unsuccesses of a borrowed and artificial 19th cent. classicism to a new forthright realism. It is in Gustav Vigeland (1869-1943), however, that Norway has at last realized a sculptor with monumental gifts. Endowed with tremendous imaginative faculty and a productive energy extraordinary, Vigeland is a towering individualist whose idea-rich, form-significant sculpture is a thing apart from school or era. In an intense personal way he expresses the universal. Through those of his many compositions called simply "Man and Woman" he communicates with impassioned power the whole gamut of basal human emotion. From 1905 on the sculptor was largely absorbed in the unique "Fountain of Vigeland", a mighty epoch of life he was creating in Frogner Park, Oslo. As an integral part of his impressive architectural lay-out rise some one hundred granite groups, sixty bronze figures and sixty reliefs centering about a dominant sculptured monolith seventeen meters high symbolizing humanity struggling for freedom. In tribute to Vigeland's genius, he continuously received State support while the municipality of Oslo presented a palatial studio to the artist in 1919 which will ultimately become the Vigeland Museum.

Wilhelm Rasmussen (1879- ) is a pupil of Vigeland who has worked with him in the execution of works for the Cathedral of Trondheim. As Professor of Sculpture at the State Academy of Art, Rasmussen has in turn had an influence on the development of two of the most talented younger sculptors, Dyre Vaa (1903- ) and Stinius Frederickson (1902- ). The latter have been contributing constructively to recent public sculptural works as are also a new gifted generation among whom Bast, Grimdalen, Janson, Lie and Schiöll are particularly active.

*Painting in Denmark.* While color gives to Norwegian painting its greatest distinction and a marked faculty for decorative synthesis characterizes Sweden's art, it is the developed sense of form that is the highest achievement of the artist Dane. Danish painting is fundamentally preoccupied with reality rather than the visionary; it is unassuming and of sterling simplicity. It is marked not by passion but integrity, by a moderation indigenous to so temperate a land. It was not, however, until the 19th cent. that a native Danish painting as such began to take root within the country itself in some independence of the archetypes set up by continental Europe which to date Danish expression had been weakly mirroring.

It was C. W. Eckersberg (1783-1853) who established the first important direction in Danish painting. Though he had early contact with the pseudo-classicism of the time through study in Paris under David and in Rome, Eckersberg was personally impelled by an entirely different drive, to paint with objective truth what he saw with his own eyes: the Dane, the Danish countryside, the Danish sea. As professor at the Academy of Art he established a school whose influence was wide, the emphasis being on truthfulness of observation and painting what lay close at hand and was thus close in meaning to the artist. Portraits and Copenhagen streets and houses particularly served as subject matter. One of Eckersberg's pupils, Christen Köbke (1810-1848) became distinguished as an outstanding observer of color affected by light and atmosphere. A master of color values, his open-air paintings, among Denmark's finest, led a new way. By the latter 30's, on the other hand, Eckersberg's followers were experimenting in Rome and once more there was a turn in direction. The painter in this group who, nevertheless, carried Danish painting far beyond the confines of Eckersberg's naturalism, Wilhelm Marstrand (1810-1873), stands as one of Denmark's most prodigious artists. His spontaneous painting of the Italian people developed in him a special feeling for the plastic possibilities of the human form

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and this he handled with a freshness that was notable. His Danish genre, historical and religious paintings were a marked departure from the old formalism in the vital relationship to real life with which they were conceived and the new directness and breadth of style with which they were treated. The note of humor and keen character interpretation which Marstrand also handled with masterly effectiveness is superbly exemplified in his drawings illustrating Holberg's comedies.

The new freedom which Marstrand's departures encouraged gave rise to two groups among the Danish painters in the middle 19th cent. On the one hand were those propagating the wide adoption of European influence, on the other, those advocating a national art. Among the more prominent followers of the former ideology the name of Carl Bloch (1834-1890) rose to temporary heights. His pictorial power, compositional merit and bold use of color were momentarily beneficial until exaggerations of these qualities made for decline in quality. The nationalists, on the other hand, were stimulated in their goal by the 1844 ultimatum of the art-historian Höyen who fervently urged a national art expressive of Scandinavia. A lack of technical adeptness was generally limiting in this group but the sum contribution of the following individuals was not without importance: Sonne expressively captured the moods of the Danish nature, particularly the Northern summer night; Dalsgaard in his interior genre paintings brought attention to the actual folk life as material for the artist as did in a less way Exner and Vermehren. Meanwhile, four painters discovered the Danish landscape and their deep feeling for the spirit of this nature Lunbye expressed with a rhythmic lyricism, Peter Skovgaard with penetration and plastically handled form, Kyhn and Rump with a special sensitivity to mood interpretation.

In the 1880's a new generation came forward in Danish painting who displayed to advantage the benefits of formal training. This they received in Paris, the center which now drew them because of the growing challenge of the realists and impressionists. P. S. Kröyer (1851-1909) became the dynamic center of the new interest in light and experimented widely with atmosphere primarily in relation to its pictorial effect. With Viggo Johansen (1851) impressionism was completely launched and he brought most successfully into his intimate Danish interior studies what he had learned in the open air concerning the reaction of light upon color. It was Kristian Zahrtmann (1843-1917) who had the added faculty for color imagination and in spite of the objective analysis of color which was engaging most artists of the time he struck forward with a subjective color emphasis that fostered not only wider acceptance of color use but encouraged individuality. His school had a constructive influence on not only Danish but Norwegian proselytes. In direct contrast to Zahrtmann's brilliant color palette, Vilhelm Hammershöi (1864-1916) held to a greyed scale of rare subtlety and his sensitively handled interiors have a restraint unequalled in ascetic and refined distinctiveness.

A movement in counter tendency to naturalism began to be felt in Denmark by 1890. Now there was a going back to the great art of the past, a seeking out of whatever period or country could provide the fundamental truths that would restore to art its ancient impressiveness. Nowhere was this new direction better realized than in the monumental frescoes of Joakim Skovgaard (1856- ) for Viborg Cathedral (1900-1906) in which from four to five hundred figures cover an area of some sixteen thousand square feet. This notable architectonic work is characterized by an influence of Greek and Italian archaism individualized by gifted artist strongly grounded in Danish tradition and genuinely inspired by the Grundtvig philosophy. Niels Skovgaard (1858- ) shares the decorative talents of his brother.

The search for style was actively pursued under the leadership of Johan Dohde; the Slott-Möllers were also enthusiasts. Nevertheless, it was a forceful individualist who came to the fore in his own right at this time who has been of greatest significance to recent developments in Danish art. J. F. Willumsen (1863- ), versatile in talent, independent, a bold experimenter, has been a powerful freeing force for the younger artists of modern Denmark from the tyranny of tradition and reactionary public. Furthermore, his noteworthy command of plastic form has been a particularly beneficial influence. Something of Willumsen's pantheistic symbolism is apparent in the pictorial compositions of Ejnar Nielsen (1872- ), another individualist who occasionally attains the monumental by way of his classic drawing. On the other hand, in this same generation a group of provincial painters tended towards a new naturalism. In their painting

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

there is a freshness and vigor as forthright as the Danish earth to which they are stating their kinship. L. A. Ring (1854-1933) is Sjaelland's master representative while the island of Fyn is ably served among other pupils of Zahrtmann by Peter Hansen (1868-1928) and their leader Fritz Syberg (1862- ).

With strong impulses from France, Expressionism was introduced into Denmark between 1905 to 1907, the experimental period culminating in the latter war years. Greater color freedom, simplification in style and concern with structural composition became discernible along two major lines; a highly abstract-decorative figure approach and an abstract-decorative landscape painting. In line with the former direction, Harald Giersing (1881-1927), Edward Weie (1879- ), William Scharff (1886- ) and Vilhelm Lundström (1893- ) were significant pioneers in their bold handling of the new formal problems. These a still younger generation have resolved further towards meeting the special monumental decoration in connection with architecture; Kraesten Iversen (1886- ), Jais Nielsen (1885- ), Harald Hansen (1890- ), Mogens Lorentzen (1892- ) and Hjalmer Kragh Pedersen (1883- ). Less radical n their departure are those expressionists who followed the second direction, taking heir lead in landscape motif: Sigurd Swane (1879- ), close in feeling to the Fyn painters, Olaf Naur (1889- ), and Olof Höst (1884- ) who has developed the psychological possibilities of color in his efforts to transcribe the mysticism of nature.

Parallel with expressionism in painting the movement has most actively penetrated the field of graphic illustration. Particularly as concerns newspaper illustration, the satirical esp., there has been in latter years a distinguished handling of the formal problem by such prominent graphic artists as Valdemar Anderson, Carl Jensen and Hans Bendix. Since Denmark's involvement in World War II and the consequent cutting of news material the Danish press has given over more and more of its copy to illustrations by the country's leading contemporary artists and has developed a new method of color lithography suitable for press printing which makes possible the mass reproduction of color of unusual quality.

*Sculpture in Denmark.* In the period of the New-Classicism Denmark contributed its sculptor of greatest stature and artist of widest influence, Bertel Thorvaldsen (1770-1844). At the Danish Academy, studying under Abilgaard (1743-1809), Thorvaldsen was imbued from early youth with an appreciation of the antique and thus upon arriving in Rome in 1797, just as the new classicism had triumphed over the rococo, conditions were perfect for his development. He stayed to work in Rome throughout his lifetime and became the acknowledged apostle of the antique not alone for his sculptural gifts but because his very temperament, simple, beautific, was the nearest reincarnation of the actual human spirit of antiquity that the period produced. The notable Thorvaldsen Museum, completed in Copenhagen in 1848, contains several thousand figures from his hand including the figures, busts and reliefs of the enormous production which he handled in one uniform classic style and spirit whether his subject was The Life of the Gods or Bible and Christian Allegory. Nevertheless, because Thorvaldsen also understood the importance of study of nature and, accordingly, was not restricted solely by analysis of the antique, there was a freshness in his creations, which his genius endowed with a marked linear harmony, a most sensitively felt balance and quiet restraint which gave to his handling of the human figure quality epochal in example.

H. V. Bissen (1798-1868), a pupil of Thorvaldsen, became Denmark's leading sculptor following the death of the master. Using, at first, male figures from Greek mythology that gave opportunity for more vigorous and dramatic treatment than his teacher's, he later gave his energies over to Denmark's oncoming national movement in art. To this end, his choosing of the common Danish soldier rather than a classic ideal as sculptural motif to be handled in his *Landsoldat,* a monument commemorating the Danish victory at Fredericia, was a radical departure and marked the severing from tradition. It was under Bissen's guidance that the next generation of sculptors worked and thereby it was his influence and indirectly that of Thorvaldsen that was the determining one until the present century. There has been no one strong movement since though there have been such able individuals as Ludvig Brandstrup (1861- ), Carl Mortensen (1861- ), Carl Bonnesen (1868- ), and Anders Bundgaard (1864- ) who were seriously concerned with the formal plastic problem through their main lead, naturalism. The painter J. F. Willumsen experimented briefly towards the truly monumental handling of sculptural form and in this Niels Skovgaard (1858- ) was

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

particularly successful from the time of his Magnus Stone which, with its figures of primitive vigor growing out in bold relief from the great rough slab of granite, was erected (1899) on Lyrskov Heath. However, it is the name of Kai Nielsen (1882-1925) that has held the widest attention in recent times. He is decidedly independent in his original handling of the female and child figure. At times there is, in fact, a kind of jocund informality in his style, even a sensual earthiness of conception, yet with an almost primal feeling for the plastic, his effective interplay of forms within a well-organized unit is surely handled. In the same generation, Gerhard Henning (1880) has been closest to Kai Nielsen in approach, while Utzon Frank (1888) on the other hand, with a highly decorative figure style in bronze, works according to early Renaissance sculptural formula. Jean Gauguin (1881- ), Jais Nielsen (1885- ) and Axel Salto (1889- ) are able artists who find the medium of ceramic sculpture uniquely expressive for their talents.

*Statens Museum For Kunst* in Copenhagen contains the most extensive collections of Danish painting and sculpture, including contemporary works, while the provincial towns have their own galleries. Most notable of the latter is the highly modern museum in the small town of Faaborg on the island of Funen devoted entirely to representative twentieth century works.

Attracting international attention has been Copenhagen's *Kunst For Varer,* Art For Goods, a voluntary organization acting through its attractive gallery in the heart of Copenhagen. Here the working or tradesman can obtain art of the highest aesthetic quality in exchange for his services or goods. In order to insure the standard, artist membership is confined to those whose work has been shown for at least five years in recognized exhibitions. This unique barter arrangement assists not only the artist in providing his material needs but makes possible the most democratic ownership of the outstanding artists' works. Thus is extended the appreciation of contemporary art among the general population according to the educational and social ideal of the organization.

*Painting in Sweden.* In contrast to Norway and Denmark where the fine arts had to initially struggle for existence and final recognition in their own right, from the time of the Renaissance a culturally influential nobility introduced them eclectically into Sweden via imported artists and subsequently fostered the thereby stimulated native talent. [illegible] in the Romanesque and Gothic periods mural painting in churches of central and southern Sweden was common but it was not until the spirited architectural program of the Vasa kings during the Renaissance that German and Flemish artists were brought into Sweden to decorate the newly built fortified castles, that painting gained formal recognition. With the Thirty Years War and Sweden's gain to political eminence and wealth as one of the Great Powers a great cultural expansion was inaugurated in the 17th cent. Again it was primarily the decoration of palace and mansion that brought the foreign painter and sculptor to Sweden but portrait painting also flourished. From France came Bourdon and Sigmac, Beck from Holland and Cooper from England but it was the German artist David Klöcker (1628-1698) who remained in Sweden long enough to exert a wide influence and train a younger generation. Raised to Swedish peerage as von Ehrenstrahl, he is loosely categorized as the father of Swedish painting. The principal monuments to his achievement are his baroque ceiling paintings in the House of Nobles in Stockholm and a collection of historical portraits.

The 18th cent. resolved into the most notable era in Swedish art annals. The influence from France was dominant. Among the determining factors was the building and decorating of the Royal Palace in Stockholm which involved the importing of an influential assemblage of French artists and craftsmen. The school of design set up in the palace for the training of Swedish youth by the visiting French artists was the beginning of the Swedish Academy of Art. Furthermore the Parliament itself began to encourage a native Swedish art largely for the economy of avoiding importation. Young Swedish artists were materially encouraged by Sweden's ambassador to France, the art patron Carl Gustaf Tessin, who, in addition, played a powerful role in his acquisition of European art collections now in the National Museum. Meanwhile Claude Lundberg (1705-1788) became recognized in Paris for his pastel portrait painting in the current French rococo style. Nicolas Lafrensen (1737-1807) gouache paintings were [illegible] and Alexander Roslin (1718-1793), whose center was also Paris, became [illegible] accepted. It was Carl Gustaf Pilo (1711-1793), however, director [illegible]

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

hagen and later at the Stockholm Academy of Art, via studies in Germany and Italy, who sounded the keynote of 18th cent. Swedish painting at home with his Coronation of Gustavus III. Pilo evidenced together with Elias Martin (1739-1818), a landscape painter in the English manner, a more distinctly Swedish expression than had been known heretofore, particularly through their color force. Actually it was during the reign of Gustav III (1771-1792) that 18th cent. Sweden reached its illustrious cultural heights. The munificent patronage of this monarch was based on an extraordinary personal interest in the arts, an understanding which had been encouraged by Tessin. "The Gustavian Period", accordingly, not only reflected the king's close contact with the prevailing European movements—the rococo had been superseded by the Louis XVI style (the Gustavian), and this, in turn, was succeeded by the Neo-Classic,—but Gustav III also encouraged any national manifestations among his young Swedish artists. In fact, art now flourished not alone in the royal domain but along with Europe's whole romantic movement, penetrated the very fastness of the entire country, enriched and in turn became diffused with the traditional.

Sweden of the 19th cent., on the other hand, more straitened economically and politically, let the arts wane grievously. A few painters surveyed the classic and romantic trends in Italy, Düsseldorf attracted another handful, Munich, in turn, some adherents. Generally, however, Swedish art was both isolated and dilettantishly static. Georg von Rosen (1843-1923), however, stands out in the quality of such historical compositions as King Erik XIV and Karin Månsdotter, and exerts lasting influence through the distinctive power of his portraits. Johan Höckert (1826-1866) painter of Swedish history and rural popular life brought color handling to new heights and is immortalized by one of Sweden's most notable paintings, The Palace Fire. Leading exponent of Old Norse in the national art efforts of the 60's, August Malmström expressed a quality essentially Scandinavian in his pictorial characterizations of the ancient sagas. Also bearing a national cast was the intimate realism of the Swedish landscape painting of Edward Bergh and Gustaf Rydberg. With the seventies, however, the younger Swedish painters journeyed en masse to Paris for a radically fresh reorientation. Alfred Wahlberg (1834-1906), who became an active representative of the Barbizon school (q.v.), had a wide initial influence and one finds for the first time the seeking to express the spiritual mood of landscape, *stämning*, to this day the most compelling characteristic of Scandinavian painting. By 1885 the new Paris group of Swedish painters, self-termed, "The Opponents" had revolted against the formalistic and stagnant policies of the Stockholm Academy and formed an independent body, *Konstnärsforbundet*, Association of Artists which for three decades played a decisive role in Swedish art. Because of their determined struggle for reform the State Art instruction as well as the National Museum were brought up to date and public opinion vitalized.

Initial leader of the new group of independents was Ernst Josephson (1851-1906), a strong colorist whose boldly approached painting generated as a liberating force for a generation to come. His celebrated *Strömkarien* (The Water Sprite) combines uniquely a northern subjective lyricism with the Manet-influenced realism he employed. Less cosmopolitan, however, were the eminent members of *Konstnärsförbundet* who, upon return from their studies in France, adapted the open-air approach and impressionist technique in a fresh and newly eager interpretation of their native Sweden. This eager contact with perspicacious observation of the intimate home scene soon brought forth a nationally Swedish art with such devoted representatives as Anders Zorn, Carl Larsson, Karl Nordström, Nils Kreuger, Carl Wilhelmsson, and Georg Pauli. Because of the essential Swedishness of his conception of the home scene, Carl Larsson (1853-1919) became the most popular national representative of his day. Basically an illustrator, there is a calligraphic quality in the water color studies of his own genial home life and glowing interiors that served as his favorite material. On the other hand, Larsson achieved something of the monumental in his depictions of Swedish history, notably his frescoes in the national museum. His joyous, humor-rich, and intimate characterizations have at once a captivating liveliness and warmth together with a handling of distinctiveness and quality unique for such informal material. He further brought the mural into school and public building, opening the way for Sweden's oncoming emphasis of art in every-day life. Pauli (1855) also produced al fresco, experimenting widely for a valid mural style and ultimately adhering to cubistic theory as evidenced in his 1913 staircase

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

paintings in the New Elementary School in his native Jönköping. Carl Wilhelmsson (1866-1928) further demonstrated the public mural form in the decorative Stockholm Post Office Harbor-Motif. It was, however, through his salient characterizations of the Swedish west coast people in brilliant color and light effects that Wilhelmsson's deep integrity as an artist came notably to the fore. Sharing his sensitive recognition of Swedish nature were three key men in *Konstnärsförbundet* whose interpretation was at once national and richly personal. Having in common the atmospheric technique of their time and a rare feeling for expressiveness of mood in landscape, Karl Nordström (1855-1922) painted with bold intensity the northern sombreness, Nils Kreuger (1858-1930) transferred the added lyricism of wide horizon with classically handled pasture animal while Eugene Jansson (1862-1915) specialized in the nocturnal effects of Stockholm mirrored in the night waters within the city.

The capturing of the pensive mood of Northern summer night has likewise been treated with distinguished insight by Prince Eugen, whose mysticism of tone is supported by stately compositional handling. His contributions to Swedish landscape painting have resolved further into an impressive fresco type such as those for the Stockholm Town Hall. Greatest of all Swedish painters of wild animal life in relationship to this poetically understood nature, on the other hand, Bruno Lijefors (1860- ) synthesizes an objective naturalist's observation with a distinctively Swedish feeling for nature and artist's discernment.

The artist who, however, among this advancing assemblage of "Opponents" received world-wide attention was Anders Zorn (1860-1920). A virtuoso and cosmopolitan in his portraits, a spirited painter notably facile in translating to canvas the phenomena of air tones, light values particularly as affecting the nude female form, the versatile Zorn was nevertheless genuinely Swedish when employing motifs from the life of his native Dalarna. Famed as an etcher, his interest in movement and the fleeting moment was brilliantly, warmly captured in the copper plate.

Around 1910 the national impression of *Konstnärsförbundet* began to be superseded by a new Swedish art pioneered by a young generation who, though their earliest studies had been at the School of the Artists' Association, developed along strikingly individual lines after the quickening experience of study under Matisse in Paris. While giving greater emphasis to formal plastic values, their work became characterized by a decorative power with color used in a bold subjective manner. Among these with color used in a bold subjective manner. Among these expressionists Nils Dardel, Leander Engström, Arvid Fougstedt, Isaac Grünewald, Einar Jolin, Carl Kylberg, Arthur C:son Percy, Gösta Sandels and Birger Simonsson have had wide influence in establishing new directions. Meanwhile, the generation successive of World War I had been more confined to the homeland, attacked the Matisse group for an overformalism, and stressed instead a return to nature and an unconventional primitive outlook. Victor Axelsson, Gideon Börje, Sven Erixon, Alf Munthe, Axel Nilsson, William Nording, Torsten Palm and Fritjof Schüldt represent this tendency with Hilding Linnquist (1891- ) esp. making a continued signal contribution to modern Swedish art, not alone through his decoratively patterned paintings similar in spirit to the Swedish folk song but in addition by his more recent murals and weaving decorations for the Stockholm City Library. Concerned rather with intellectualized pure form is Otte Sköld while among the experimenters in current painting frontiers are the celebrated critics Gösta Adrian-Nelsson and Otto Carlsund. Among the outstanding schools of the Swedish provinces, on the other hand, is that of Scania with such distinguished painters of the local scene as Svant Bergh, Emil Johanson Thor, and Johan Johansson. Halland's group of young painters, ***Halmstadgruppen,*** have been developing their expression and technique along surrealist lines with Axel Olson, Stellan Mörner, Sven Jonson, Erik Olson, Waldemar Lorentzon and Esaias Thoren gaining recognition at their exhibitions in Stockholm's *Akademien För De Fria Kosterna* since 1932.

Among the illustrators and graphic artists of contemporary Sweden Albert Engström's masterly humor-rich drawings of distinctively Swedish types take an outstanding lead. Gustaf Isander specializes in Stockholm studies while Fridell, Johansson-Thor, Jansson, Sallberg dominate in the fields of portrait and landscape and the ilustrators Berg, Lybeck, Jungstedt and Elgström contribute vitally to such public organs as press and periodical.

*Sculpture in Sweden.* The earliest sculpture of note in Sweden was the Romanesque and Gothic ecclesiastical art on the island of Gothland, while the outstanding medieval work

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

was the statue of St. Göran and the Dragon (-480) by Bernt Notke of Lübeck for *Storkyrkan* (the Great Church) in Stockholm. During the Renaissance sculptors from the continent, particularly the German and Dutch, were commissioned to decorate the castles of royal house and nobility and in the 18th cent. French artists were imported including Larchevesque, teacher of Johan Sergel (1740-1814), Sweden's first great sculptor. Sergel's expression ran the gamut of French Rococo to Italian neo-classicism but the static forms of his time were transformed by the vigor of his genius into vitally personal statements. Reflecting his plastic power are the *Reclining Faun, Mars and Venus, Gustavus III.*

It was during the dynamic maturation of a nationally Swedish art in the 80's that a native sculpure also became grounded. John Börjesson (1835-1904), Per Hasselberg (1850-1894), Christian Eriksson (1858-1935), and carl Eldh (1873- ), while holding primarily to an academic realism, achieved a mastery of form and an integrity of expression distinctively Swedish, corresponding to that of their fellow artist-painters in *Konstnärsförbundet.*

The most revolutionary change in plastic directin, however, was stimulated under the new leadership of Carl Milles (1875- ), Sweden's most eminent contemporary sculptor and resident-artist since 1931 at Cranbrook Academy of Art, Bloomfield Hills, Michigan. Milles' creative genius finds impetus from the archaic Greek, also the Gothic and baroque, but is resolved powerfully into an original stylization which seeks the monumental and restrained even in the highly imaginative and decoratively vigorous forms which are so uniquely his own. Architectural, landscape and particularly fountain sculpture, involving massive figures of heroic proportions, engage his major attention. The whimsically grotesque as well as stark pagan mood come frequently into play with naiads and tritons the basis of rhythmically conceived, highly simplified organic form as in *The Meeting of the Waters Fountain,* St. Louis. The *Orpheus Fountain* for the Stockholm Concert Hall is, on the other hand, notably representative of the highly stylized anatomy, exaggerated slenderness and controlled ecstatic expressiveness of his figure designs.

Among the younger sculptors incited by Milles' departures, Ivar Johnson (1885- ) whose austere David statue in Hälsingborg is noteworthy, Olof Ahlberg, arl Frisendal, Eric Grate, John Lundqvist, Nils Möllerberg and Nils Sjögren are in the forefront. In latter years, however, French influence has been particularly strong, Maillol and Despiau serving as favored prototypes.

In Sweden wide understanding and appreciation of the fine arts has been fostered among the masses particularly since 1930 by the traveling study exhibitions of *Riksförbundet för Bildande Konst,* The National Association for the Development of the Arts, which comprises the Swedish museums, institutions and organizations whose aims are to advance art. This highly organized cooperative activity has led to the founding of such popular movements as *Sveriges Allmänna Konstförening,* The Swedish People's Art Association. The society *Konsten i Skolan,* Art in the School, on the other hand, commissions Sweden's leading artists to execute murals for the public schools. Furthermore, through *Konstradet,* The Art Council (founded 1938), the Swedish government purchases or commissions works of art for public buildings, appointing a percentage of the cost of each building for this purpose. Most powerful of nation-wide organizing forces for bringing art to all the people through every possible educative agency of film, radio, press, pamphlets, popular courses, lectures, exhibits and expositions are The National Museum, The Röhss Museum of Arts and Crafts and the Swedish Association of Arts and Crafts (*Svenska Slöjdföreningen*).

There has been an extraordinary upturn in the national art consciousness since the spring of 1940 when an art crisis brought on by the war was diverted and resolved with momentous results by the timely support of the National Museum in association with other leading art organizations. In a unique exhibition, arts and crafts were introduced side by side with paintings and purchases were made both by the government and lay public. Since that successful turn the contemporary art market has flourished under the growing investments of the average citizen. Of incalculable import is the press which has been a singularly powerful ally of the nation's current art manifestations. Above all the feeling for what is essentially Swedish in art has become increasingly evident on the part of both artist and consumer. Furthermore, in spite of the evacuation of permanent collections, the National Museaum alone held forty-five temporary exhibits of painting, sculpture, drawing, engraving and arts and crafts in the three year period 1940-42.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*20th Century Scandinavia's Art-in-Industry Movement.* Largely responsible for the high standard of contemporary production in the Scandinavian countries are those national organizations which were created to work for the advancement of art in craft and industry and for the improvement of public taste. In Sweden *Svenska Slöjdföreningen,* The Swedish Society of Arts and Crafts, has been the central clearing house through which this phase of the country's aesthetic education has been skilfully organized on a nation-wide scale. Since its founding in 1845 this association has faced systematically the problem which unguided machine production ahd brought. Subsidized by the Swedish Government, *Slöjdföreningen* was designed to arouse a nation-wide critical consciousness of the status-quo, to stimulate an awareness of the possibilities for beauty in everyday living and to serve as contactor between industry, the art world and the general public. Because of its influence producers began as early as 1914 to collaborate with artists. Initially the Society lessened the risk of manufacturers reluctant to take the artist into their ranks by lending money under very generous conditions to factory owners who were willing to experiment with the production of finer forms in glass, ceramics, metalwork, textiles and furniture. As for the artists, the younger ones were esp. willing to co-operate with *Slöjdföreningen* which, in turn, sought to establish them as designers with the various manufacturers. They worked directly in the factory where they came to understand intimately the special characteristics of the raw material and also gain first hand knowledge of technical matters. Fellowships for advanced instruction in techniques and craftsmanship were given by the Society to young artists of promise. (Today, however, artists previously distinguished in painting, sculpture or professional craft are also widely affiliated with manufacturing concerns.) In 1919 the motto *Vackrare Vardagsvara*—"More beautiful things for everyday life"—was adopted and since has been emphasized constantly by the press, periodicals, and every possible educative agency. With this aim the Society, among its wide range of activities in the campaign, has arranged for traveling exhibitions to be sent to all parts of the country, covered as wide a field as possible with lectures, issued instructive pamphlets, published *Form,* the leading organ in the north for industrial art and collaborated closely with both the industrial art and the public school. As a result of this extensive educational program, a real public demand for quality and aesthetic considerations in goods began to make itself increasingly evident. Moreover, the Society, with the assistance of the best artists and experts, worked out patterns and models which proved stimulating to both manufacturer and craftsman alike. In addition, a fine collection of illustrative material was gathered and put at the disposal of industry. As a result of this effective artist-manufacturers' union fostered by *Slöjdföreningen,* Swedish industrial art had attracted much attention from foreign countries already by 1924 and at the Paris International Exhibition of Decorative Arts in 1925 Sweden's leadership in this field was universally acknowledged. Since 1930 the Association has put special emphasis on the artist-in-industry designing for mass production methods thereby so cutting costs that home furnishings and everyday-ware of high technical and aesthetic quality have been made available at a price range within reach of the entire populace. This activity has been greatly stimulated by the social building program of the Swedish state which has provided even the lowest income groups with modern housing and stimulated democratic and spirited participation in the whole new movement for an improved home culture. *Svenska Slöjdföreningen* has reached, however, not only the individual of the nation but since 1925 has arranged on country-wide scale the remodeling or planning of office, shop and hospital along rational and modern lines exerting incidentally thereby a wide influence on the taste of the lay public. In the first three years alone thirty hospitals were redesigned and refurnished under the aegis of Sweden's leading artist craftsmen. Of further moment are the yearly competitions arranged by *Slöjdföreningen* among, e.g., the wallpaper concerns, the ceramic manufacturers, etc. to foster and reveal superior production.

With a similar, sound working program the Norwegian *Foreningen Brukskunst,* The Association of Applied Art, established in 1918, has generated throughout Norway an appreciation of fine modern forms and made them available to the people at large. Denmark, in like manner, through its *Forening for Kunsthaandvaerk,* has also been highly successful in achieving an effective working alliance between artist, producer and consumer. The Norwegian organization holds periodical exhibitions in its handsomely modern Oslo headquarters where the public may study directly the latest artist-manufacturer

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

collaborative output and learn at which shops they may purchase the furniture, fabrics, etc., displayed. The Danish association, on the other hand, is instrumental in the running of a unique institution notably effective in encouraging uniformly high standards among producers and a forward-looking consumer emphasis. *Den Permanente,* the Permanent Exposition of Danish Art Handicraft and Industrial Art was established in 1931 with large display quarters in a central Copenhagen business locale. The exhibition represents the current production of furniture, textile, ceramic and related Danish firms as well as the work of individual professional craftsmen. All goods featured must be first approved by an advisory board (organized by the aforementioned *Forening for Kunsthaandvaerk*) as to design quality and workmanship. Constructive criticism is available to the exhibitors as well as guidance to the interested public. Furthermore, not only can the latter get a cross-view acquaintanceship with the contemporary market but also purchase on the spot.

The cooperative course now collectively followed by Swedish firms towards the policies of *Svenska Slöjdföreningen* was already well affirmed by the Stockholm exhibition of Swedish Industrial Arts and Crafts in 1930 which, as its catalog stated, was a conclusive review of "Sweden's contribution to the present day endeavor to combine sound quality and attractive appearance by the utilization of artistic resources in dwellings and objects of furniture, particularly those intended for general use." It is, in fact, in the furniture area that recent changes are particularly manifest. To this end Carl Malmsten, Sweden's leading furniture designer and craftsman is serving the two most influential firms concerned with aesthetic quality in mass production, *A.-B. Nordiska Kompaniet* and *A.-B. Svenska Möbelfabrikerna.* The wide influence of the forward-looking s m a l l e r establishments *Svenskt Tenn, Domus, Futurum, Pefta* and *Studio* is also calculable. It is, however, in Swedish glass that the rest of the world has found leadership in the creation of excellent types of domestic glass with Hald, Gate and Lindstrand of *Orrefors,* Elis Bergh of the *Kost* works and the newer firm *Strömbergshyttan* doing notable frontier experimenting. Nevertheless, it is in the two china factories of most venerable tradition, *Gustafsberg* and *Rörstand,* that a radical change away from stereotyped production is most actual. Their engaging of the artists Wilhelm Kage and Edward Hald, respectively, has resulted in a change in technical method, ascertained to be the basis of former poor taste, and a consequent rationality, tasteful simplicity and cost as low as to bear no competition. As for pottery, the most interesting and distinctively Swedish is now produced by the small workshops, *Tobo Stengodsverkstad* under Ingrid and Erich Triller and the faience firm of *Jobs.* Among contemporary jeweiers Wiwen Nilsson of Lund and C. Hallbergs *Guldsmedsaktiebolag* have met special recognition for the quality of their departures while Baron Erik Fleming and Jac. Angman are acknowledged leaders in silver. Furthermore, the present interest in textiles has made for an important output along contingent lines, home crafts, professional studio-made and machine-made fabrics. A firm of rare individuality in the face of its timely production is that of Elsa Gullberg *Textilier och Inredning.* Märta Maas-Fjetterström, modern Sweden's most eminent textile artist also expresses a unique personal quality in the markedly original *flossa* and *röllakan* rugs which are her specialty.

Basic to the success of the artist-in-industry movement in Sweden has been the recognition on the part of he manufacturing concerns to the need of opportunity for purely personal expression on the part of the artist apart from his factory affiliation. Accordingly, working hours are halved and his independence to carry on his own studio production is not only respected but fostered as a guard against any possible mechanical creation. This freedom and the versatility of commissions taken on by the artists is typified by a gifted leader among them today, Ewald Dahlskog whose table ware continuously being developed for Bobergs *Fajansfabrik* is supplemented by such projects as his intarsia panels for Stockholm's Concert House or his frescoes for the City Hall. Einar Forseth and Arthur G:son Percy, in the same way, while one day engaged at their respective porcelain works creating beauty in utilitarian ware, are the next absorbed at their own easel or at work in the decoration of bank, cinema or restaurant.

Outstanding among Norwegian industrial artists is Sverre Pettersen of Hadeland *Glasvaerk* who has brought household glass to new heights in technical and aesthetic quality as has Nora Gulprandsen of Porsfrunds *Porslaensfabrik* in the area of distinctive porcelain dinner ware for the general market. Modern stained glass has recently been an era of wide experimentation among Norwegian designers and has been handled with

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

unusual plastic power in expressionist church windows by Fridis Haavardsholm. Leading woman artist of 20th Century Norway, she has also contributed significantly to the renaissance in design of ecclesiastical raiment, her chasubles for the Trondheim Cathedral, for example, bearing a striking modern character. Silver also is a particularly favored medium among contemporary artist-craftsmen and the notably advanced and timely treatment is evidenced in he simple, organically conceived forms typical of the national production and largely stemming from the leadership of the famed Oslo firms Tostrup and David Anderson. The artists staffing these concerns have been intensively trained at *Statens Handverks og Kunstindustriskole* which since 1934 has been under the active directorship of Jacob Prytz, himself a master goldsmith who is also manager of Tostrup's and organizer of the *Brukskunst* movement. To be further noted is the wide use of enamel in small objects and restrained ornamentation, a special feature of the Norwegian goldsmith's art.

A close collaboration between architect and craftsman has resulted in a rational furniture production suited to the needs of the modern-type interior universally built since the 1920's. An extensive use of metal in furniture manufacture is also manifest. Moreover, smart furnishing fabrics have been made available to the general consumer by joint action of the professional weaving studios and textile factories under the *Brukskunst program*. On the other hand, monumental picture tapestries distinctily modern in conception have been executed of late years by the leading textile artists Sigrid Mohn, Tora Qviller, Frida Hansen, and Ulrikke Greve for public buildings, as the new Oslo City Hall, and the recently built Norwegian passengers liners. Of the latter, the S.S. Oslofjord, the interior decoration of which was executed by the combined efforts of Norway's leading artists and craftsman, represents an excellent cross section of Norway's highest pre-War II production. This is reflected in the fresh approach not only to the Norse murals and artist-designed furniture, fabrics and rugs but in the newly handled wall-surfaces of hand-blocked linen and native woods (to the Peer Gynt designs of Per Krogh), the vigorous ceramic reliefs of Maja Refsum and free pictorial tiles by Hvalstad and Scheel decorating smoking room and bar. The library likewise bears evidence of the intimate cooperation recently developed between publisher and artist accounting for the handsomely designed typography, illustration and binding of not only luxury volumes but particularly the popularly sold books. In the same way the embroidery, knitting, weaving and entire field of women's handwork has been profoundly affected by the tasteful and contemporary patterns executed for popular use by the country's outstanding artists who are also contributing thus to Norway's exhaustive drive for aesthetic quality in everyday living.

Denmark's modern industrial art is conspicous for its excellent craftsmanship along with an optimum feeling for material and elegant simplictiy of design. This is most evident in the famed Danish silver production which had its impetus under the organization of the pioneer genius Georg Jensen (1866-1935) but which has since his generation resolved from the elaboratively decorative to that monumental simplicity of character found in the work of the firm's present staff G. Albertus, Grundlach-Pedersen and Harald Nielsen. First to commission designs from leading Danish artists was the establishment of the court jeweller, A. Michelsen. Typical of the highly restrained contemporary conceptions are those by the architects Kay Fisker, Kaj Gottlob and Palle Svenson and the painter Stähr-Nielson, while new departures are under constant development by the silversmith Frantz Hingelberg of Aarhus.

Among other Danish concerns distinguished by the creative production of top-ranking artists as Knud Kyhn, Jais Nielsen and Jean Gauguin are *Den kgl. Porcelainsfabrik* (The Royal Copenhagen Porcelain Manufactory) and *Bing & Grndahl A/S* (The National Factory of Porcelain). Greatest emphasis has latterly been put on quality everyday ware. Among the excellent ceramic factories in outlying Denmark is Kähler's in Naestved which has had in its employ the sculptor Kai Nielsen, the painter Svend Hammershi and now enjoys the ceramic gifts of Jens Thiirslund. Stoneware in particular is engaging the interest of most of these artists at present because of its marked plastic possibilities. To be specially noted is that of the painter Axel Salto, the ceramist Bode Willumsen and Natalie Krebs of the firm Saxpo. As for glass manufacture, newly stimulated by the Swedish, *Holmegaards Glasvaerk,* under the architect Jacob E. Bang, has most successfully initiated a tasteful production of simple glass forms for daily use. The "P. H. Lamps" designed by Architect Poul Henningsen and used widely over the Continent are a singular Danish contribution to the area of electric

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

lamp fixtures in the industrial art industry. As for furniture, the highly skilled professional cabinet maker holds a prominent place with heavy popular demand for his individual pieces. Among the commercial firms, however, Fritz Hansens house is a typical producer of pleasingly simple and serviceable bent-wood and metal types. Smartly modern furniture and curtain fabrics, have been increasingly demanded, the relatively newly established studios, the workshops Askovhus, Gerda Henning, Marie Moos and Karen Warning being most prominent. Book-binding as an art has also made recent strides under the distinguished craftsmanship of Jacob Baden, Anker Kyster and August Sandgren. In the field of toy design too much attention has been given outside of Denmark as well to the wooden block, boat, car and similar forms developed by the silversmith Kay Bojesen.

In Denmark as in Norway and Sweden the Museums for Industrial Art have contributed in great measure to the general appreciation of modern design by their current exhibits of contemporary applied arts and active cooperation with the special organizations for fostering art-in-industry. Also the wide provision for instruction in advanced design and professional craftsmanship has provided these countries with a richly equipped talent. In addition, the creative versatility of the Scandinavian architect, whose formal training in his own field is significantly complemented by extensive study of the fine arts as well as industrial design, has been of momentous import in that he has been exceptionally well prepared to serve as coordinator of the various forces that play into the dynamic new design of art in society. To this end it will be seen that museum nad organization leaders are most often architects as are frequently the frontier designers in furniture, metal, ceramics.

*Modern Scandinavia's Home Arts and Crafts Movement.* In each of the Scandinavian countries there is a national organization with branches in all parts of the land, which is seeking, by means of wide adult education to promote home arts and crafts along sound contemporary lines. This movement for a renaissance in handicrafts, developing side by side with the currents in the art-in-industry program, has likewise been affected by the general improvement in taste, by the new consciousness of organically conceived functional design, by an awakened social awareness and emphasis on a creative design for living for the masses of people. Purely decorative handwork of the old pastiche character has given way to simple, practical forms for daily use. Weaving, for example, has been popularly revived, attention being focused on the creation of a variety of attractive and substantial materials for clothing, curtains, upholstery. Thus, handicraft since the 20's has received increasing social recognition and has gained a place of respect unknown since the onslaught of industrialism because it now stands for utility, for quality, for intrinsic beauty, and because in its modern simplicity it harmonizes with and becomes part of a machine age environment.

In pre-World War II Norway the whole problem of handicrafts had been attacked afresh and translated into terms of the new needs and demands of twentieth century living by the most comprehensive, highly organized and nationally important government-subsidized system of modern times. In its educational and cultural aims it seeks to promote home handicraft and the development of good taste, individuality, and quality craftsmanship by means of instruction and propaganda. Further, in support of one of the economic objectives of this movement to make possible for below-minimum incomes to be supplemented by means of home arts and crafts, a substantial market is provided through the sales shops of member organizations over the country. Four hundred local *Husflidsforeninger* or home arts and crafts associations, under yearly state grant for their educational work, direct their energies towards providing opportunities for the training of people of all ages and all levels of society. This they have largely realized through arranging series of ambulatory courses, establishing permanent *husflid* schools, holding study exhibitions, publishing texts, working-drawings and designs and maintaining collections of patterns and models for general popular use. The State provides a central *husflid* school for women which offers advanced courses and provides teacher training. In addition are fourteen other State subsidized *husflid* schools for women and thirteen for men, four hundred *arbeidsskoler* for training young people in handwork and over seventy *arbeidsstuer* to encourage small children in creative endeavor. Supplementing these are in turn numerous craft courses now provided in the agricultural and continuation schools. Attention has been focused on building up skills and knowledge of materials as a basis for individual creativity.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Furthermore, the economic aspect of *husflid* has been developed in Norway as a relevant part of the general cultural program. This consideration has made possible the economic of many, and the self-sufficiency of many more. Besides, the organized *husflid* production for sales purposes presupposes a market which sets up standards that demand aesthetic and technical quality in goods, a market which in turn stimulates the whole native production to a higher character. Besides, the *husflid* sales shops in the Norwegian towns also act as important guidance bureaus for local producer and lay public and centers for *husflid* promotion.

In order to foster this united activity in Norway, an administrative set-up has been developed whereby the local *husflids-foreninger* gather into county units, *fylkes husfildsdag*. These in turn, together with *husflid* schools, museums, and other institutions and groups with *husflid* on their programs, become members of a national association, *Norges Husflids-og Husindustrilag*. This latter body, administered by a central office, *Husflidsstyret,* a common council of representatives, *Husflidsradet,* and a general assembly *Landsmtet,* is represented finally by a council within the Department of Agriculture, *Landsradet for Husflid, Husindustri og Smaindustrie. Landsmtet* is a national meeting held every third year. *Husflidsstyret* is elected by this assembly. *Husflidsrad,* on the other hand, a board of representatives to which each county *husflidslag* elects a delegate, come together with *Husflidsstyret* in yearly meeting. *Landsradet,* with permanent office in Oslo supervised by the State's *husflid*-inspector, is now the official integrating body and the authority for *husflid* activity over the country. This arrangement in organization has proved to be a practical and democratic one, as is provides for independent local initiative as well as local representation in the greater collective endeavor of planning the nation's general lines of direction. Since 1930, particularly, all classes of society have been actively participating in the movement.

The Swedish and Danish home arts and crafts systems are broadly speaking parallel to the Norwegian one though each one bears a unique individuality. In 1912 *Svenska Hemslöjdsföreningarnas Riksförbund,* a national league of all the local homecraft organizations in Sweden, was ofunded. Planned to act as a centralizing agency and provide contact between the existing local associations, according to its laws the *Riksförbund* was further designed to maintain and develop *husflid* on the basis of the old folk arts, to bring together producers and other interested persons, to discuss *husflid* matters and act on common questions, to foster a united activity for raising the level of *husflid* instruction, to facilitate exchange among the *foreninger* in regard to their experiences in promoting *husflid* and to work for the preservation and improvement of native raw materials. Joined under the *Riksförbund* are thirty-four *husflidsforeninger* representing each province of the country; also *Föreningen för Svensk Hemslöjd,* a pioneer Stockholm agency whose highly distinctive showrooms bear evidence of the highest quality contemporary craft, furniture included. Because the *Riksförbund's* aims included making known and selling *husflid* products, in 1928 it founded a marketing division, *Hemslöjdsförbundet för Sverige,* with permanent show rooms and sales shops in Stockholm. In behalf of the member *husflidsforeninger* this organization promotes their goods in Sweden and abroad and sells on consignment basis, sending a report every third month to each province. Unlike the Oslo shop the Stockholm one does not provide patterns and directions for producers but, while it offers advice and stimulus, encourages each province from Skane to Norrbotten to send in its own typical and self-determined work in order to maintain the regional integrity of the native production in regard to material, color, form, pattern and purpose.

In Denmark the home arts and crafts program, of minor importance compared with that of Norway and Sweden, is under the central authority of *Dansk Husflidsselskab.* There are no sales outlets and simple, practical men's crafts dominate in emphasis. Since 1928, however, *Selskabet til Haandarbejdts Fremme,* with sales shop in Copenhagen and Odense, has been developing a quality production of extraordinary distinctiveness.

In 1926 *Nordens Husflidsforbund,* a cooperative alliance of the home arts and crafts organizations of Norway, Sweden, Finland, Denmark, Iceland and Estonia was established. This organization then convened at the first *Nordiske Husflidsting* held in Stockholm in May 1927 and thereafter every third year, the member countries rotating as meeting places.

It has been well said that Scandinavian art not only forms a unity but a trinity as well. While Sweden stands supreme in bringing art into industry it looks to the monumental painting of contemporary Norway as a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

mutually completing part, to the sound craftsmanship of Denmark, "the art appreciator", as an important supplement to its own expression. In fact, while the temperament of their art is individual, there is to marked degree reciprocal recognition and interaction of those values indigeneous to the tranquil lowlands of Denmark on the one hand, to the violent heights of Norway on the other, and to Sweden where nature too runs the middle course. **Scandinavian glass.** See GLASS AND GLASS-MAKING.

**scauper.** A tool used in engraving.

**scenae frons.** See STAGE-SETTING.

**scenario (or continuity, shooting script, screen play).** The manuscript of the narrative expressed in terms of shots and sequences, from which the director works. It often contains, besides a complete literary description of the visual images that compose the film, plans and drawings of the sets and of the camera positions. When dialogue is added to description of the action, the manuscript is usually called a screen play. —I.B.

**Scheele's Green.** The Swedish chemist, Carl Wilhelm Scheele, first prepared this painter's pigment in 1778. It is somewhat similar to emerald green, being also a compound of copper and arsenic. It shares the disadvantages of that, however, in being easily discolored by sulphides and by sulphur-bearing air. It has now been largely abandoned. —G.L.S.

**scherzo.** An instrumental piece of animated character. The scherzo of the symphony (q.v.) was developed by Beethoven from the minuet, (q.v.) of Haydn and Beethoven.

**schizzo** (It.). A sketch.

**schloss, burg, festung.** See castle.

**schola cantorum.** See NOTATION.

**school art museum.** See art museum, school.

**schuhplatteltanz.** This German national couple dance of Bavarian origin takes its name from one figure in which the man slaps his leather breeches and the soles of his shoes in a brisk rhythmic pattern. Very simple in form, the dance consists of a waltz introduction or promenade, a single major figure, and a delicately restrained conclusion suggestive of a minuet. In the dance proper, the woman whirls continuously while the man moves about her with pantomimic gestures and the rhythmic motif of slapping his breeches and shoes. —J.G.

**Schweinfurt gren.** See emerald green.

**sciences of signs and symbols.** See AESTHETICS, RECENT TRENDS IN.

**scope of vision.** See PERSPECTIVE.

**score.** *Mus.* A systematic arrangement of all the vocal or instrumental parts of a composition placed on separate staves one above the other.

**scorper.** See scauper.

**Scotch carpet.** See ingrain carpets.

**scotia** (Gr. *skotia,* darkness). A classical moulding of a single concave curve of more than an approximate quarter circle or ellipse.

**scraper.** A three-cornered sharp tool for scraping the lithographic plate to make corrections. See PRINTS AND PRINT PROCESSES.

**scratchboard.** A type of chalk-covered cardboard used for drawing on with pen and ink, crayon, etc.; the board has a smooth surface with line or stipple tint and the lights desired are achieved by scratching them out with a steel tool.

**scriber.** See ENAMELLING ON METAL.

**script writer.** See RADIO DRAMA.

**Scriptores.** A collection of treatises on musical theory by medieval Latin writers was made available by Martin Gerbert (3 vols.) in 1784 entitled *Scriptores eclesiastical de musica.* Another collection was issued by C. E. H. Coussemaker (4 vols.) 1864-76 entitled *Scriptores de musica medii aevi.* A facsimile edition of both editions appeared in 1931.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The treatises included in these collections are indispensable for research in medieval music. For contents of both collections see article, *Scriptores,* in Grove's *Dictionary of Music and Musicians,* 1935. —V.A.

**scrollwork.** An ornament which has its characteristics and main possibilities for variations on the framing parts of a plate, plane, label, etc. In contrast with the greater part of ornamental forms which developed in the course of time or which were revived in modern times from ancient forms, the scrollwork means an ornament for which—in its proper appearance—we can nearly state an actual birthdate. It is natural with the scrollwork that its main accents are developed on the framing zone of an object. Even if we consider related motifs in the rolling ends of ribbons, hat brims, etc., which we can trace during the Middle Ages, or in the ending volutes of classic capitals already—for it is obvious for any unfastened ending to get rolled—the scrollwork as such was created but in the 16th century. In the decorations of the Castle of Fontainebleau, France, in the Gallery of François I (1494-1547) we find the first genuine scrollwork, executed by Rosso Fiorentino between 1535 and 1540. Its formations show all the typical characteristics: (1) an elastic body with a plain surface, without reminding of any natural formations; (2) the framing motif, symmetrically built up; (3) the decoration built up within two layers which become evident towards the framing zone where the endings of both planes are interwoven and pierce through each other. Thus the scrollwork has an outspoken three-dimensional character.

The Italian *cartoccio*—a little plate very often used for the inscription of the artist's name or for that of the portrayed—prepared the development which was achieved in Fontainebleau by Italian artists. On the other hand, the three-dimensionality makes the scrollwork an ornament closely linked to Baroque tendencies.

The usage of the scrollwork was largely encouraged by the masters of ornament engravings. Artists like Cornelis Floris and Cornelis Bos in the Netherlands, or Virgil Solis in Germany helped a lot for its spreading, by the publication of whole series of engravings; thus they gave the model for silver and goldsmiths as well as for interior decorators, sculptors, etc. Naturally, like the grotesque or the mauresque or arabesque, forms of the scrollwork were used very frequently in combinations with other ornament forms like especially the above mentioned. See Peter Jessen, *Der Ornamentstich,* Berlin, 1920; Max Deri, *Das Rollwerk in der deutschen Ornamentik,* Halle, 1905; Rudolf Berliner, *Ornamentale Vorlageblätter,* Leipzig, 1926; Robert Hedicke, *Cornelis Floris und die Florisdekoration,* Berlin, 1913; Lotte Pulvermacher, *Das Rollwerk in der süddeutschen Skulptur und seine Entwicklung bis ca. 1620,* Strassburg, 1931; Kurt Kusenberg, *Le Rosso,* Paris, 1931; *Katalog der Berliner Ornamentstichsammlung,* Berlin, 1935. —L.P-E.

**sculptural canon.** See canon, sculptural.

**sculptural portrait.** See portrait, sculptural.

SCULPTURE. *The General Situation.* Whereas many people succeed in establishing some sort of relationship to painting mainly because of its content (the story) and its color scheme, sculptural creation stands in peculiar isolation. This is understandable as one can see usually in sculpture only a very poor "story".

*Aspects of Representation.* To primitive man, representation of an object meant the same thing as being able to seize it, to own it personally. It brought before his eyes in human dimensions the object which moved or overpowered him in order to put it to his service.

The incomprehensible fact of death is made more tangible by mummification. Man is changed into a doll; the dead ancestor, the root of the family, remains as a mummy in the family possession. A later stage, by death mask, sublimates this process. This may be the origin of the portrait.

The possessive point of view is extended to beings who live only in the world of imagination. There is a strong contact with ancestors, goods, personified powers of a rich pantheism. Captured within a definite form, they became—even if prayed to as deities—servants of man.

Clay, wood, stone come to life under the artist's hands. He perceives the existence of the typical, and what is *common* to different phenomena. Then one day the slightest deviations from the typical are observed. To the original observation of the typical features are added the individual characteristics.

The slightest twitchings of the muscles of the face and body are given their values in expression. The whole representation is brought down to infinitely fine gradations. The way leads from the typical to the indi-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

vidual. And when no further progress in this direction is possible, when the representation has reached mechanical identity, the rebound occurs: instead of tangible realism something different takes place: a neutralizing calmness, stylization, a striving for indifference toward the psychic aspects. This leads to a more conscious emphasis of the expressive and meaningful effects of material, shape, volume, and their relationships. This is a great discovery: a language of form available for expression. In the transitional period toward abstract sculpture common objects are represented, a bottle, absinthe glass, violin. There little value is placed on photographic resemblance but very much more on elements as concave-convex, curved and angular, solid and perforated, horizontal and vertical, smooth disappear. The expressive importance is condensed in the relationships of sculptural elements. Not the representation of a person, animal or object, is the real problem here, but the paramount organization of relationships of volume, of material, of mass, of shape, direction, position and light. To these elements through his biological nature everyone can have a direct, unadulterated relationship. This is the basis of a new aesthetic reality leading to abstract, non-objective sculpture.

There are a great number of other elements, mainly technological, which help to define this new type of approach. But these elements are only variations of the age-old consequences in the use of material and tools with which one creates a certain product.

*Fundamental attitudes in treating materials.* Sculpture can be approached from different viewpoints: tool, material, form, volume, size, proportion, balance, positive-negative, setting, expression, etc. The most natural appreciation comes from the way it is *made.*

If several people are handed a block of material to be worked on, certain fundamental tendencies will appear in all, in their way of handling the material.

At first the worker respects the homogeneity of the block. He examines it, feels it all over, estimates its weight, its dimensions. Then he starts—according to his temperament, in the passive mood of a spectator, nor in the active mood of an experimenter—to work on the block with a tool, his purpose quite clear. He knows what he would like to create but as he proceeds he may see that his tool and his material allow him only a limited freedom. He has to adapt himself to their requirements as he goes on; he unconsciously assumes the role of a meticulous artisan; he slowly becomes better acquainted with his material and his tools. He invents methods, discovers new implements, dares to proceed more drastically: to make recesses, holes; he penetrates deeper and deeper into the block. In this way **negative volumes** (hollow spaces, voids) are produced. He notes the relations between full and empty, between round and angular, dull and sharp, small and large, raised and indented. Such an articulation of the means is the basis of sculpture. But to articulate, one must thoroughly know his means.

*Sculpture is volume creation.* As man faces his material, experiencing it, it becomes a factor in his practical knowledge that sculpture is the best form—the original form—for taking possession of volume. Compared with volume, everything else, the kind of making, weight, structure, representational idea, likeness, expression, proportion, rhythm, consistency, color, etc., is secondary, belonging more in the sphere of mastery of details. They do not count primarily for the essential grasp of volume, and thus for the main values of plastic expression. It must be stated, however, that the most intensive method of conceiving volume, has in the course of our cultural history been more and more superseded by an intellectual conception of likeness to known objects. Thought content and illustration overrode the form, description supplanted grasp.

*The five stages of development of sculpture from the standpoint of treatment of the material.* In working with the material and in discovering the volume relationships, as they become more and more clear, we may set down various stages of plastic development—not alone in the individual, but as well in the history of Western, Eastern, and any other cultures. These stages are:

1. **blocked-out**
2. **modeled** (hollow-out)
3. **perforated** (bored-through)
4. **equipoised** (suspended)
5. **kinetic** (moving)

} sculpture

These explanations refer in general to sculpture-in-the-round which finds its justification in fulfilling its own laws—like easel painting without architectural relationships. The legible meaning of this development may be summarized also as the path of freeing the material from its weight: from mass to motion.

*Parallel phenomena.* One can find close parallels to this development toward dissolution of material. There are certain processes

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in nature which exhibit the same tendency; e.g., water in rest, in motion, in gaseous form, liquid and solid. Water exists as tiny spherical drops, and as a smooth, plain surface stretching out far and wide. It may appear as a placid or rushing brook, as a raging sea, as plattering rainfall, spraying fountain, drifting cloud of steam. It may be frozen: as snow, ice, crystals on frosted window panes, etc. These manifold changes arise from an extraordinary variety and adaptability of its forms. One may easily feel moved to employ water as a medium of expression. In earlier periods water, as responsive to adaptations, was recognized as an important medium of creation and its natural possibilities were exploited according to the expression desired. Its form was changed from a tranquil mass to the complete dissolution of an almost ethereal form; from the calm lakes of the baroque parks to gushing fountains, or a chain of foaming cascades. All such efforts were directed to displaying water under as many aspects as possible, and dematerialization played an important part in the process.

In every cultural period a phalanx presses forward in every field of creation, in art, science, and technology. It often happens that one field pushes out from this united front, like an advancing wedge. This condition does not last long; the other lines surge onward; the phalanx is re-united, mostly even without the knowledge of the respective workers.

Thus a similar quest is made for expression by subduing or lightening the material as in sculpture: from mass to motion; in painting, from colored pigment to light (play of colored light); in architecture, from restricted closed space o free, open space articulation.

*The first stage of sculptural development.* The block of material which shows its mass in plain, almost untouched volume as the pyramids; dolmens, natural monuments; meteorites (the Caaba at Mecca), crystalline blocks, prisms.

*The second stage.* The **modeled** (hollowed-out) **block:** Small and large mass (volume) relationships of salient and sunken, positive and negative, round and angular, sharp and dull. Void can be understood as **negative volume** and it can be used as the legitimate contrast to the **positive volume.**

*..The third stage.* The **perforated** (bored-through) **block** is the third stage. After mastering the relations of all legrees of positive and negative volume, an intensive penetration follows into the material, creating polar contrasts. The completely perforated sculpture is a heightening to the very limits of hollow and full.

*Succession in time.* In the history of sculpture the different stages of plastic development occur successively. Each closed culture (Egyptian, Indian, Greek) shows at the beginning the barely modeled block and as a next step the more or less carefully modeled piece, penetrated to a greater or less extent. The same approach is found among the sculptural work of the pre-literary natives of the so-called "primitive peoples" (American Indian, Negro, and South Sea) where sculptural creation rests on very old traditions.

*The fourth stage of sculptural development.* What comes beyond the complete perforation of the third stage is a speculation that we, still deeply rooted in our yesterdays, can scarcely grasp; a bold sublimation of the material, a triumph of relations pure and simple. It is the **equipoised sculpture,** the self-contained volume. Its preparation can be traced in the consequent steps of sculptural development. In an illusionistic way they appear in baroque churches as angels suspended in the air, even earlier, in the Gothic cathedrals, sculptures hovering on cantilevered platforms. Sculpture "normally" rests on a heavy base, occupying a certain position in relation to its surroundings. It also has relationships of direction to the earth: horizontal, vertical, oblique. The equipoised sculpture, contains *theoretically* only relationships of material and volume, and all other possible elements *within its own system.*

The freedom from relationships to points eternal to the sculpture means the fourth stage of sculptural development; it means a floating volume in space freed from the complication of gravity forces. This problem is at the same time the crux of the problem of equilibrium, which is an important part of the total problem of plastic creation.

That is a long way from the Renaissance idea of appreciating sculpture from only one certain, "the best" position. This was the mechanical application of the vanishing point, the central perspective of paintings to a three-dimensional object. This of course could have been seen from any point if the canon of looking at pictures would not have had its influence upon the sculptors, too. The reaction against the dogma of viewing sculpture from one point and making it so, came up lately with the introduction of the idea to make sculpture-in-the-round.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Examples of equipoised sculpture which do not depend on illusion, namely, by the use of glass, or of almost invisible wires, on which the sculpture is hung, are very hard to find. Such a sculpture must effectively be kinetic sculpture as well, since only through the action of opposed forces can it be brought to balanced rest in equipoise. Analogous solutions could be seen in balloons, airplanes, toys. All these are, however, limited in their formal quality by unavoidable, compulsory considerations of power, which must overcome gravitation. The actual realization of equipoised sculpture will be possible only with the application of magnetic forces or remote electrical control. Such a possibility is shown in a simple way by an electromagnetically controlled metal bar floating between two glass plates.

Within the system of equipoised sculpture we can find again three former stages of sculptural form: (1) the block, (2) the modelled, (3) the perforated.

*The fifth stage.* In the lightening of masses the next step beyond equipoise is **kinetic equipoise,** in other words, **mobile** or **moving sculpture.** There the volume relationships are mainly virtual, i.e., resulting from movement usually of thin bodies, rings, rods, and other objects. Here the material is utilized not in its mass but as a carrier of movements. To the three dimensions of volume, the fourth —movement—(in other words the *time element*) is added. The originally heavy block of material, the solid volume, transforms itself—depending upon the speed of motion—into a kind of ethereal extension appearing without mass and heaviness. **Mobile** is a weightless poising of volume relationships and interpenetrations. With this transformation, the original phenomenon of sculpture which equaled material plus mass relationships, changes to a dematerialized, abstract formula: sculpture equals volume relationships.

*The history of kinetic sculpture.* The history of kinetic sculpture begins far back in the ancient ages, with the very first Greek hydro-clock, and later in the different clockwork automata with moving figures in the Middle Ages. As a step toward kinetic sculpture in our own time one may single out toys, advertising signs, fountains, fireworks and the like. These often contain interesting suggestions for experiments. Recently the futurists have came forward as conscious propagandists of the "dynamic" as a principle of artistic creation. Boccioni presented the first **dynamic sculptures** in his *Pittura, scultura futurista* (*dinanismo plastico*). In 1912 he wrote: "The futurists broke down the concept of repose—the static—and put forward that of movement—the dynamic. They showed the new grasp of space by bringing into contrast the inner and the outer."

Written as a challenge to the aims of the Russian constructivists, the **Realistic Manifesto** of Gabo and Pevsner, Moscow, was published in 1920.

"Space and time are the two exclusive forms for fulfillment of life, and therefore art must be guided by these two basic forms if it is to encompass true life."

"To incorporate our experience of the world in the forms of space and time: this is the single goal of our creative art."

"In sculpture we eliminate (physical) mass as a plastic element. Every engineer knows that the static power and power of resistance of an object do not depend on mass. One example will suffice: railway tracks. Notwithstanding this fact, sculptors labor under the prejudice that mass and contour are indivisible."

"We free ourselves from the thousand-year-old error of art, originating in Egypt, that only static rhythms can be its elements. We proclaim that for present-day perceptions, the most important elements of art are the kinetic rhythms."

In 1922 L. Moholy-Nagy published, in collaboration with Alfred Kemeny, a manifesto on *The Dynamic Constructive System of Forces.* "Constructivism means the activation of space by means of a dynamic-constructive system of forces, that is, the constructing within one another of forces actually at tension in physical space, and their construction within space, also active as force (tension)."

"We must therefore put in the place of the static principle of classical art the dynamic principle of universal life. Stated practically: instead of static material construction (material and form relationships) dynamic construction (vital constructivism and force relationships) must be evolved, in which the material is employed only as the carrier of forces."

"Carrying further the unit of construction, a dynamic constructive system of force is attained, whereby man, heretofore merely receptive in his observation of works of art, experiences a heightening of his own faculties, and becomes himself an active partner with the forces unfolding themselves."

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

"The first projects looking toward the dynamic-constructive system of forces can be only experimental demonstration devices for the testing of the connections between man, material, power, and space. Next comes the utilization of the experimental results for the creation of freely moving (free from mechanical and technical movement) works of art."

*Duality of volume?* This progress obliges one to use the term "volume" in several ways, though basically they form a unity. There are the following meanings of **volume:**

(1) The clearly circumscribed mass, body of measurable weight, tangible in the three dimensions is the customary description of volume.

(2) But there exist negative volumes, too: the voids, holes and openings; they are perceived merely visually; they are—although bodiless—yet outstanding plastic elements.

(3) Then there are the volumes produced by the motions of points (smallest bodies), linear elements, or larger bodies. The results are virtual volumes, new elements of plastic creation.

To sum up, sculpture is both material—volume and its transformation into virtual volume; from tactual grasp to visual grasp.

*Ability to recognize a certain stage of sculptural development does not mean necessarily an aesthetic experience.* To define sculpture on the basis of technological development is far from an exhaustive treatment of the problem of sculptural creation. It means only the first steps toward a really thoroughgoing experience. The five stages of plastic development offer merely the rough differentiations of the outward technical conception. They are an introduction to the first recognition of the creative problems involved in perceiving sculptural form. The complete experience of a work in sculpture implies—along with an intuitive basic grasp—knowledge of the workings of other elements as well.

Such elements are the geometrical and **biotechnical elements of construction.** (Raoul France, the Hungarian biologist, has distinguished seven biotechnical constructional elements: crystal, sphere, cone, plate, strip, rod, and spiral [screw], and says that these are the basic technical elements of the whole world. They suffice for all its processes and are sufficient to bring them to their optimum.) Laws of light, motion, size, mass (proportion), relationships of structure, texture, surface treatment, representation, expression, etc. As is the case everywhere, it is true here that a wide and comprehensive knowledge of characteristics and elements is less important for creative work than the capacity and the courage to build up new relations among the elements of expression already at hand. What is really important is to raise them above the commonplace by giving them a new meaning through shifting their connotations.

Without this, elements, harmonious in themselves, can never grow into an organism. They remain only a series, forming perhaps a rich arabesque, but of no significance in the sense of the building up, of the biological "nourishment" of man. —L.M-N.

**sculpture, ceramic.** See CERAMICS I.

**sculpturesque painting.** See POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U. S. A.

**seal.** (1) A matrix or die engraved on metal or gem stone for making an impression in wax or other soft material placed on a document to indicate authenticity. The word is also used legally to mean the impression itself. The art of seal cutting is of great antiquity. Cylindrical seals were in use in Egypt and Babylonia and beautiful examples of gem engraving are found in the ancient seals of Greece and Rome. After the fall of the Roman Empire the use of seals in Europe declined except for the Papal bullae stamped in lead, and was not revived until the latter part of the 8th cent. In the 11th cent. Edward the Confessor introduced the pendant seal hung to the document by a parchment strip. Since his time each monarch has had his own great seal. Seal engraving reached its peak of skill and beauty in the 14th cent.

The Great Seal of the United States, well known from its reproduction on the one dollar silver certificate, was designed in 1782 and recut last in 1902. Each State has its own seal, of which some are artistic while others violate the canons of both heraldry and beauty. Colleges, corporations and other organizations have their individual seals. The dies for seals, medals and coins are now cut by machine from large models. See HERALDRY; sphragistics. See Frankfort, *Cylinder Seals*; Birch, *Seals.* —T.E.F.

(2) An impression made with a stamp, generally accompanying the signature on East Asiatic paintings. Usually applied with vermilion pigment. See *in* (Jap.); *yin chang* (Ch.). —J.A.M.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**seal carving.** See CHINESE ARTS; MESOPOTAMIAN ART.

**secco recitativo.** See OPERA.

**Secessionists, the.** See art nouveau.

**secondary colors.** See COLOR.

**secondary highway, street, etc.** See CIVIC PLANNING.

**secretary.** See writing; FURNITURE.

**sedimentation.** See expression.

**seggar.** See sagger.

**segmental.** Having the form of a part or arc of a circle; anything characterized by the use of such a segment.

**seguidilla.** One of the classic Iberian Spanish dances, is perhaps the one most universally performed. Each region or province has its own version, which often retains few of the original characteristics and occasionally is given another name. In general, the style of the dance places most emphasis upon movements of the arms and torso, accompanied by rapid footwork in alternation with high leg-swings. The motions of the upper body are performed with elegance, the torso at once supple and erect. The dancer accompanies himself upon castanets. Each figure is also given the support of a short verse of love-poetry called a "copla." —J.G.

**Sehna knot, Persian knot.** Takes its name from a town in Persia. This technique is seldom found in European rugs. The short length of wool (or other fibre) is "wrapped around" only "one" warp thread. The ends are brought forward to the surface with a warp thread between them. This makes on the surface a tuft of wool (half the knot), then a warp thread, next another tuft or wool (the other half of the knot) and then the other warp thread. —B.E.J.

**seiji** (Jap.). Celadon, or green pottery ware.

**sekki** (Jap.). Stoneware.

**selenium cell.** See electrical instruments.

**Seljuq art.** See ISLAMIC ART; PERSIAN ART.

**selvage.** The method of securing the edges of the rug so that the knots forming the pile are protected in which contiguous warp threads are included in the weaving process with weft threads, but lacking pile threads. —B.E.J.

**Semantic notation.** See NOTATION.

**semantics.** See AESTHETICS, RECENT TRENDS IN (1).

**semi-abstraction.** See abstraction.

**semi-breve, — c, —f, — minima, — pausa, — quaver.** See NOTATION.

**semi-formal script.** See writing.

**sendal** (O. F. *cendal*; Gr. *sindon*; Skr. sindhū). (1) A thin silk fabric used in the Middle Ages. (2) A kind of linen.

**Senoufo art.** See AFRICAN NEGRO ART.

**sensu** (Jap.). Folding fans, the surfaces of which are often decorated by the best artists.

**sensu-e** (Jap.). Paintings for folding fans.

**sepia.** Both as the name of a color, a neutral brown, and as the name of a specific coloring material, this is familiar in the fine arts. The coloring material provided an ink that was known in classical times but evidently was little used in Europe until the latter part of the 18th cent. Then it was taken up for ink drawings and for water color painting. It is a secretion from the ink bag of the common cuttlefish or squid and from other related species. —G.L.S.

**seppa** (Jap.). Washers placed on both sides of the sword-guard.

**sepulchre** (L. *sepulcrum*, a burial-pplace). A grave, tomb, or place of interment.

**sepulchrum.** See altar.

**sequence.** (1) *Mus.* (a) The chromatic or whole-tone repetition or progression of a melodic or harmonic figure. (b) In the Roman Catholic Church a kind of hymn founded on the alleluia (q.v.). The popularity of the sequence attained its height in the 12th cent. during the time of Adam of St. Victor (d. 1192), the most famous and prolific writer of sequence-texts. A great number gradually found their way into the Church services. With the exception of five, all were excluded from the official Church song by the Council of Trent (1545-63).

1. *Victimae Paschali laudes* by Wipo of Burgundy (d. 1050). For Easter Sunday.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

2. *Veni sancte spiritus* variously ascribed to Robert the Pious, King of France (996-1031), Hermannus Contractus of Reichenau (1013-54), Pope Innocent III (d. 1216), and Stephen Langton, Archbishop of Canterbury (d. 1228). For Pentecost.
3. *Lauda Sion Salvotorem* by Thomas Aquinas (c. 1225-74). For Corpus Christi.
4. *Stabat Mater dolorosa* by Jacopone da Todi (c. 1306). For festival of Seven Sorrows of Mary.
5. *Dies irae* by Thomas of Celano (13th cent.). Interpolated in Requiem Mass (q.v.).

The five official sequences are to be found in the *Liber Usualis.* A complete collection of sequence texts is available in G. M. Dreves, *Analecta Hymnica* vols. 50, 53, 54 (1886-1911). For a discussion of the melodies see P. Wagner, *Einführung in die Gregorianischen Melodien,* vol. 3, 1921. See MEDIEVAL MUSIC. —V.A.

(2) *Motion Pictures.* A series of shots developing one single phase of the narrative, and observing within them a unity of time, place and action, or a unity of theme. —I.B.

**serenade.** *Mus.* (1) An evening song of a quiet character. (2) An instrumental piece of such character. (3) A sort of suite (q.v.) in several movements.

**serge.** A fabric with a twill weave.

**serial.** See RADIO DRAMA.

**series, photographic.** See PHOTOGRAPHY.

**series title.** *Book.* The name of the series of a book usually found at top left hand of half-title page, but sometimes taking the place of the half-title.

**serigraph.** See PRINTS AND PRINT PROCESSES.

**serigraphy.** A name coined by Carl Zigrosser, Curator of Prints, Philadelphia Museum of Fine Arts for the silk screen process as a fine arts reproduction printing medium. The screen is prepared in the regular manner. (See *silk screen.*) A lithographic tusche (*ink, oily in nature*) is painted on the silk where the flat color is to be printed. When the tusche is dry a solution of one part glue, one part water, is lightly scraped over the entire surface of the screen. The glue fills in all the open spaces in the mesh of the silk and does not adhere to the lithographic tusche (oil and water do not mix). The tusche is removed by turpentine soaked rags, leaving the design to be printed clear and free of any tusche. Silk screen poster oil base colors which come in paste form in quart containers must be thinned to the consistency of heavy cream before using. An extender base is used to extend the color—a transparent base is added to make the color transparent when desired. Mixing varnish is used to thin the color to the right consistency. One color is applied at a time throughout the entire edition. The screen is cleaned with turpentine to remove the glue. Tusche is again applied to the screen for each additional color. The first edition is the last and can never be exactly duplicated when the design on the screen is removed. See *Silk Screen Color Printing,* Harry Sternberg; *Silk Screen Stencilling as a Fine Art,* G. I. Bregelisen, M. Cohn. —B.E.J.

**serpent.** See MUSICAL INSTRUMENTS.

**serpent bracelet.** See JEWELRY.

**serrated dovetailing.** See TAPESTRY.

**Set.** Ancient Egyptian god of evil, brother and enemy of Osiris.

**set-back.** A requirement that a structure be built a certain minimum distance from a specified reference line, such as the edge of the street—applied either to the foundation or to higher parts of the structure. See CIVIC PLANNING. —T.I.C.

**Seto yaki** (Jap.). Pottery made in the province of Owari.

**settee.** See FURNITURE.

**settle.** See FURNITURE.

**seven color ware.** Chinese porcelain with the following seven colors: red, yellow, green, blue, violet, black and aubergine.

**seven gods of luck.** See SYMBOLISM IN FAR EASTERN ART.

**seven jumps (syvspring, sieben sprünge).** This lively dance cannot be definitely assigned to one nation, since it seems equally native to Holland, Denmark, Belgium, and Germany. The music varies from country to country, but the dance is virtually identical in all four. It is a strenuous, semi-comic dance of alertness, in 2/4 meter, usually performed by two men. The "jumps"

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

are sections of the dance. At the end of each section, the musician holds the last note indefinitely, forcing the dancers to maintain their last position for an unpredictable period and still to be ready for the first note of the next section. The seventh "jump" leaves the men down on both knees with foreheads touching the floor. Skips, jumps, stamps, and rapid whirling are characteristic of the movement. —J.G.

**Seven, the Group of.** See CANADA, ART OF.

**Sevres ware.** See CERAMICS II.

**sewing.** *Book.* In theory there are three (at least) forms of binding the sections of a book together. (1) Sewing. (2) Stitching. (3) Stabbing. But they overlap to some extent in practice. Stabbing is stitching with wire or thread from side to side, near the back fold, but this must not be confused with over-sewing, in which the stitches are smaller and closer. Sewing and stitching are often used synonymously. But the latter describes the sewing of a single section or sections sewn singly to some other substance. Sewing is applied to the work when all the sections of a book are sewn or bound together either by machine or hand. —H.E.S.

**sextodecimo.** See book sizes.

**sfumato** (It. smoked). Hazy in outline. See atmospheric perspective.

**sgabello.** See FURNITURE.

**sgraffito** (It.). A ceramic technique whereby the design is produced by scratching through an overglaze revealing a different colored ground. See CERAMICS II.

**shade.** See tint; PERSPECTIVE.

**shading-wrinkling.** See CHINESE ARTS.

**shadow.** See PERSPECTIVE.

**shaft.** In archaeology: (1) The part of a column or pier between capital and base. (2) A vertical passage or well-like excavation.

**shagreen.** An artificially pebbled leather, or the rough skin of the shark, or ray.

**Shakespeare-theatre.** See THEATRE.

**shakudo** (Jap.). A special black bronze finish often used on sword-guards.

**shaman's drum.** See MUSICAL INSTRUMENTS.

**shan mien** (Ch.). Fan paper or silk for fan paintings.

**shan shui** (Ch.). Mountains and water; a type of landscape painting.

**shape.** See form.

**shard.** See sherd.

**sharkskin.** The pebbled rough skin of the shark. Sometimes confused with the similar-looking skin of the ray when seen covering the handle of a Japanese sword.

**sharp.** *Mus.* The sign (#) which raises a note a semi-tone above its sound in the scale of C major. See NOTATION.

**sha t'ai** (Ch.). Stoneware; a term applied to pottery when the body, under the glaze, has a dense, stonelike quality.

**shawm, shalm.** See MUSICAL INSTRUMENTS.

**shê.** See MUSICAL INSTRUMENTS.

**shedding.** Raising and lowering warp threads.

**sheets.** *Book.* The book before it is bound or folded.

**Sheffield plate.** See METALWORK.

**shelf.** A horizontal top set into or against a wall; being at least twelve inches in width and more than three feet six inches above the floor. See CIVIC PLANNING.

**shellac.** Now commonly used in interior house-painting, this resin has little place as an artist's varnish. Probably one reason for its being abandoned was its rather intense orange color and its cloudiness when this is bleached out. It is also slow to dissolve and, because of that, might endanger paintings if an attempt were to be made to take it off at a later time. It is a resinous secretion of the lac insect and now comes largely from India. —G.L.S.

**shoin-zuquri** (Jap.). See JAPANESE ART.

**shoji** (Jap.). Sliding panels covered with thin tough paper. Used, in architecture, as inner partitions where light must be admitted. —J.A.M.

**Shoso-in** (Jap.). A famous 8th cent. treasure-house in Nara, Japan.

**shot, the.** One separate visual image on the screen, its time length being determined by thematic or rhythmical considerations (see cutting). —I.B.

**shou.** See SYMBOLISM IN FAR EASTERN ART.

**shozo** (Jap.). A portrait.

**shrine.** A sacred place or object, as a receptacle for relics. See reliquary.

**shrinkage.** *Cer.* The amount of volume lost by contraction in drying and in burning.

**Siam, art of.** See SOUTHEASTERN ASIATIC ART.

**sibyl.** A prophetess.

**siccative.** A material which is added to oil paints by artists in order to promote more rapid drying. Their use, particularly in excessive amounts is usually held to be detrimental to the life of the paint. —R.M.

**sickle motif.** Also called crescent pattern; a decorative pattern, used on Greek pottery, consisting of a row of long, vertical curves resembling a sickle or crescent. —L.T.S.

**side elevation.** The drawing of an object as though it were only possible to see one side (face) of its mass (volume). It is drawn at eye level.

**siderography.** The art of engraving on steel. The word is now used more specifically to mean the transferring of an engraving from one steel plate to another as done in bank-note engraving. —T.E.F.

**sienna pigments.** The raw and burnt sienna are earth colors similar to the ochres but somewhat finer in grain and more translucent. In color raw sienna is comparable to yellow ochre and, burnt, it becomes a warm reddish brown. —G.L.S.

**Siena, school of.** Siena, city of pageants and mystics, was throughout the 14th and 15th cents. the last stronghold of medievalism in Italy. The work of its painters, too, is the final artistic expression of the spiritual intensity of the twilight of the Middle Ages.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The first Sienese master whose name is known to us is Guido da Siena (fl. ca. 1250-1270). The famous Madonna of the Palazzo Pubblico, painted in 1271, is an Hodegetria in the Italo-Byzantine manner. One of the greatest of the Sienese painters was Duccio di Buoninsegna (fl. 1278-1319), whom the Sienese regard as the precursor of Giotto in his innovations in realism. Actually, his style is a combination of classic, Byzantine, and northern Gothic elements, combined with an extraordinary intuition for dramatic expression and a realization of the sacred legend in human rather than hieratic terms. These qualities may be seen particularly well in the panels of the *Maestà*, the altarpiece for the cathedral of Siena. The straining pathos and ghostliness of his Madonnas is achieved through meaningful distortion and the employment of ecstatically moving line. The use of line as an instrument of spiritual expression was brought to its highest fulfillment in the hands of Simone Martini (d. 1344). In his masterpiece, the Sant' Ansano Annunciation of 1333, the earthward descent of Gabriel, the startled recoil of the Madonna, are shown in lines suggestive of the angel's settling to earth and the Madonna's staccato agitation. Simone's visit to the Papal court at Avignon, 1339 to 1344, was responsible for the introduction of the Sienese style to northern Europe. A no less poignant expression of the Christian legend is seen in the work of Pietro Lorenzetti (d. 1348) who adapted the Florentine idiom of monumental form to a typically Sienese emotional expression. His brother Ambrogio (d. 1348), likewise Giottesque in training, is chiefly famed for his didactic allegory of Good and Bad Government in the Palazzo Pubblico, Siena. With the frescoes of Barna in the cathedral of San Gimignano we come to the last great monumental work of the Sienese school in which the dramatic effectiveness of Duccio is combined with the more heroic manner of the Lorenzetti. The 2d half of the 14th cent. was a period of stagnation, marked by the work of such minor followers of Simone Martini as Andrea and Luca Vanni (d. 1375) and Barna's collaborator, Bartolo di Fredi (d. 1410).

Throughout the 15th cent. the artistic tradition of Siena remained essentially medieval, untouched by the scientific progress of the neighboring school of Florence. Rigorous prohibitions discouraged the work of foreign artists who might have introduced the innovations of the Renaissance. Siena drew apart from change. Sassetta (1392-1451) revived the linear tradition of Simone in a peculiarly rarefied and lyric style of his own. That strangely neurasthenic personality, Giovanni di Paolo (1403-1482), presented his dreams of the Christian story in an idiom almost surrealistic in the extravagance of its distortions. The only truly Renaissance painters of Siena were Domenico di Bartolo (fl. 1428-1447), who had learned something of Masaccio's dignity of form, and the engineer, Francesco di Giorgio (1439-1502), who rivalled Botticelli in his mastery of poignant line and the luminous beauty of his types. His imitator, Neroccio dei Landi (1447-1500), perpetuated his formula in an endless series of sentimentalized Madonnas. Vecchietta (1412-1480) in his best work was capable of evoking mystic visions still conceived in the terms of the great school of the 14th cent. Some slight suggestion of Florentine monumentality is to be found in the work of Matteo di Giovanni (1435-1495) who specialized in the production of Madonnas of a cool and aristocratic nature. By the end of the 15th cent. the Sienese school was a completely worked out and exhausted tradition. Such artists as there were engaged in the endless repetition of no longer meaningful formulae.

The only painters of any note in the 16th cent. were Sodoma (1471-1549) and Domenico Beccafumi (1486-1551). The former was an eclectic who managed to combine elements borrowed from Signorelli and Leonardo. Beccafumi was a mannerist who in his distortion of the human form and preoccupation of lurid effects of lighting produced paintings strangely suggestive of the work of El Greco. I ff., 1923; Weigelt, C., *Sienese Painting of the Trecento,* 1930.

—B.R.

**signature.** *Book.* (1) A sheet after being folded. (2) The letters or figures at the foot of the first page of each folded sheet or section. Does not always appear when the page number is at the foot of the page commencing new chapters, etc. In large books after the alphabet has been used once it is the practice to continue AA or 2A, etc.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Sometimes both figures and letters are used at the same time. —H.E.S.

*Mus.* The collection of sharps and flats (qq.v.) to indicate key (q.v.).

**signatures on paintings.** See FORGERIES IN PAINTING.

**signet ring.** See JEWELRY.

**significant form.** See architectural form.

**sikhara.** See INDIAN ART.

**Sikyatki.** An ancient Hopi village on First Mesa, a center of ceramic industry in the Pueblo IV period, from which Sikyatki pottery takes its name. See Hopi Art. When this ware was discovered, in the excavations made on the site in the late 19th cent., it stimulated Nampeyo, a gifted potter of Hano, to revitalize the current decadent ceramic craft and to restore to the wares of the First Mesa the high quality of the ancient product. Nampeyo's own pottery is now nationally recognized as among the finest of the Pueblo wares. —H.G.

**silenus** (Gr. *seilenos*). A companion of Bacchus; the most famous of the satyrs. There was never a clear separation between the two concepts of Silenus and Satyr. In archaic times the shape of the sileni is half animal, half human. Later they resemble more human beings, though they generally retain the long pointed ears and the tail. In this shape they appear frequently in Greek vase painting and sculpture. A famous example from antiquity is the *Satyr* by Praxiteles, a lost work known only through literature. There are, however, many replicas of satyrs pouring wine which are brought in connection with Praxiteles. One of the best known is in Dresden (illustrated in *The Sculpture and Sculptors of the Greeks by* Gisela Richter, New Haven, 1929, Figs. 682-684). The picture of the old drunkard Silenus is based on the *Cyclops* by Euripides. In this shape he appears in Rubens' picture "The drunken Silenus" in the *Alte Pinakothek* at München. Rubens painted the picture at about 1616. The Baroque, with its predilection for allegory, made ample use of such mythological subjects. Another Flemish painter attracted by the motif was Jacob Jordaens. The goat-legged satyr in his picture *The Satyr and the Peasant's Family* in the Gallery of Kassel, Germany is one of the variations which Jordaens painted on the subject of the Aesopian fable. —L.L.

**silica.** Well known in the arts for its importance in glass making, glazing and fired enamels, this element also provides filler or extender for the manufacture of artists' paints. This is a silicon dioxide, a natural product. Like other fillers it is mixed with pigments of high tinting strength or intense color in order to give them greater bulk and lower cost. —G.L.S.

**Silk.** Silk is produced by the mulberry silk moth bombyx mori, indigenous to China. The silk industry has flourished in China from a remote period, native writings recording that the Empress Si-ling, wife of the Emperor Huang-ti, discovered the method of reeling silk from the cocoon and devoted herself personally to sericulture; she is often called the Goddess of Silk Worms. The secret of silk culture was jealously kept in China for many centuries. Korea learned the silk secret and in the 3d cent. A.D. imparted the knowledge to Japan. Tradition says that a Chinese princess carried silk worms' eggs wrapped in her hair into India but the Indians never developed silk culture to its highest point because of religious scruples which forbade the killing of the silk worms. (Cocoons pierced by the worms yielded short staple silk far inferior to the silk reeled from the cocoons. The product of this silk is coarse and rough, as in pongee or tussah silk.) Sanskrit literature states that a silk industry existed in India 1000 B.C. Persia is said to be the first country to import silk from China. The oldest known Chinese patterned textiles are those which were discovered by Sir Aurel Stein in the Lop Desert Chinese Turkestan in 1914. The site where the textiles were discovered lay on the route opened by the Chinese for silk trade with Western Asia in the 2nd cent. B.C., which leads to the belief that these textiles date from before the Han Dynasty. These fabrics show intricate weaves and designs of griffins, animals, birds, scrolls, wave patterns, cloud forms, bearing a remarkable resemblance to later Chinese work. The spinning of the threads shows an intricate technique and tapestry weaving is used (cf. *Scrindia,* Aurel Stein, 1921).

Aristotle is the first writer to describe the silk worm and its metamorphosis suggesting that the conquest of Alexander in the 3rd cent. B.C. must have disclosed the secret of silk. We read that Justinian, the great Emperor of Byzantine was struggling to discover the secret of silk in the 6th cent

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

A.D. There are many interesting accounts of the sensational history of silk in Rome. (See *Ciba Review*, No. 11, The Early History of Silk.)

The earliest known silks of Persia belong to the time of the Sassanian kings who ruled from 211 A.D. until the Mohammedan Conquest in the middle of the 7th cent. A.D. No silk fabrics of that time are known to exist today but rock cut reliefs show what the patterns were like. The influence of Babylonian and Assyrian designs are seen in the Persian patterns (e.g., twin griffins facing a palm tree which is between them). Sassanian influence persisted after the conquest of Persia by the Arabian hordes.

In Persia the palm had superseded the "Tree of Life", the "Horna" of Assyria and Babylon. The Sassanid weavers adopted the sea monsters, griffins and lions which the Greeks had taken from the Orient and then returned in modified form to the Orient.

In the 7th cent. identical twin motifs enclosed in a circle became the prevailing pattern. These designs reached their finest development during the reign of the last Sassanid king of Jesdegerd who was dethroned by the Arabs in 640. The endless pattern repeated on surface appealed to the ancient Persians (Sassanians) and to their Islamic conquerors. These patterns symbolize life beginning in the unknown and continuing to the unknown. They liked to have a part of a pattern appear on each salvage suggesting the infinite continuance of the design. The colors of the Sassanid silks were the wonder of the world. Vegetable, mineral and animal dyes were used and mordanting was known. The prevailing colors were deep dark blue, dark green, red, brown, purple, yellow and black.

Syrian weavers adopted the technique and the comparatively limited range of subjects of the Sassanids. The conquest of Persia by the Arabs served to increase the tendency toward geometrical designs. The Mohammedan distaste for the reproduction of nature is the same as that of the ancient Hebrews. (Neither, however, were always faithful to the commands of the Koran and the Old Testament to make no image of anything on land or sea.) Persian art was too vigorous to be quickly changed by their Islamic conquerors. The traders of Islam spread the silks of Persia far to the east and to the west. From the 7th cent. on Persian silks influenced Chinese and Indian weavers as well as Turkish weavers. The Seljuks (Turkish) followed most closely the Persian designs and later showed the Islamic influence. In Bagdad and Samarkand great silk workshops flourished, turning out patterns of intricate weaves perfectly done which were destined to become the object lessons to the whole of Europe. These are the designs which gave the great impetus to the European Renaissance. Cufic script formed an important part of the designs developed under Mohammedan influence. In the 11th and 12th cents. silks from Tiraz workshops showed floral patterns combined with animal motifs with the same arrangement of twin motifs enclosed in roundels placed side by side. There is no question but these patterns helped to develop the Gothic style. The Byzantine silks show human figures. The Byzantine blending with the Spanish Islamic design dominated the famous textile work shops of Sicily which flourished in the 12th cent. A graceful likeness pervades all designs. Twin lions are often woven into the silks by the weavers of Bagdad and Isaphan, but there is no rigid geometrical form. A graceful lightness pervades all the work.

In the year 800 Charlemagne received gifts from Haroun Al Raschid of oriental fabrics which inspired Charlemagne to establish spinners, weavers and dyers in his own shops to emulate and equal the technique shown in the oriental fabrics. Whether or not Charlemagne's industries survived after his death is not known. There is a letter in the archives of Lyons, France, in which the Consuls in 1399 ordered 10 lengths of red satin from Avignon for the making of robes of office.

In the 14th cent. silk weavers of Lucca settled at Lyons. It is probable that these weavers gave Louis XI (1423-1483) the inspiration to start the production of fine fabrics in Lyons. Probably Italian weavers were gathered in these workshops; it is recorded that a Greek weaver wove all the metal threads used. The dyers of these fabrics were all Frenchmen. Louis XI ceased patronizing his Lyons weavers but they continued to struggle on helped by their fellow citizens. Etien Turquet, a cloth merchant of Italian descent, recognized that there was a need for silk production in Lyons so he gained the patronage of Francis I and set out to break the velvet monopoly of Genoa. Soon there were 1200 people in Lyons alone engaged in the manufacture of silks. The real prosperity of Lyons silks, however, came in the reign of Henry IV (1589-1610) when they finally outdid the Italians in color and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

design and quality of workmanship. Also, about this time a silk weaver, Claude Dangon, invented a silk loom on which patterned silks could be more easily woven.

Colbert, Minister to Louis XIV (1619-1683), realized the importance of the Lyons industry and reorganized the factories and regulated the output, ushering in a great creative period of the French textile industry. But the greatest prosperity of the Lyons industry occurred in the 18th cent. when Prussia, Spain, Russia (Catherine the Great), ordered silks and draperies for court use. Periods of court mourning and changes in style (as when Marie Antoinette affected muslins and plain simple silks) wrought great hardships on the silk weavers. Later, the French Revolution almost brought the Lyons industry to ruin. After the Revolution Napoleon became a great patron of the Lyons industries, ordering the women of fashion to wear Lyons silks. Wall hangings of silk became the fashion and Napoleon rewarded the weavers whose work attracted his attention. The prosperity of the French weavers of Lyons lasted through the Restoration of the Republic, the Second Empire and the Third Republic. Finally, the Jacquard loom, power driven first by steam and then electricity, took the place of much individual labor and threw thousands of weavers out of business. Adjusting itself to the machine age, Lyons became the center of the world production of creative design not only in silk but wool, cotton, linen and rayon. —G.W.R.

Besides its use as a textile fibre, silk has served in making the fabric supports for a great deal of Far Eastern painting. Except for scattered works done on linen and other fabrics and for the painting on walls, silk and paper have served to carry what is generally familiar as the painting of the Far East. Technically known for its strength as a fibre, this has a double filament and microscopically takes the appearance of a lustrous rod. —G.L.S.

**silk painting.** See CHINESE ARTS.

**silk rugs.** See ISLAMIC ART.

**silk screen print.** Silk screen process is a method of printing a flat color design through a piece of silk, called Swiss bolting cloth, which has previously been tightly stretched over a wooden frame firmly fastened to a table by means of hinges with removable pins. The design is transferred to the silk—all parts of the design not to be printed are stopped out by a resist medium. Silk screen printing can be applied to many surfaces such as glass, plastics, wood, metal, leather paper and cloth. The printing medium such as a lacquer, water color or oil base, is slowly pushed through the open meshes of the exposed silk by means of a long wooden-handled squeegee edged with hard rubber. Only one color can be printed at a time. The same silk and frame can be cleaned and used repeatedly for different designs.

The silk screen method of printing had its origin in the stencil, a craft process first produced by the Chinese and Japanese as a medium for decorating many of their beautiful textiles. These stencils were cut from layers of paper made from the fiber of the mulberry tree and were treated to withstand the intricate cutting of the stencil knife. Some of the Fiji Island tribes used the stencil cut from a banana leaf as a border decoraion on their bark fiber cloth. The stencil was also used in conjunction with the woodcuts in the early history of playing cards in Europe. Decorative stencilled wall papers were introduced into France by the *Dominotiers,* "makers of domino papers". Americans living in pre-revolutionary times used the stencil as a decorative device on furniture, floors, ceilings and walls. As late as 1925 many French designers were reproducing limited deluxe art book editions by the stencil method.

The discovery of attaching a stencil to a piece of silk nailed to a wooden frame is obscure. England, France and Germany played their part in the development of this new discovery. After World War I the silk screen process began its rapid development as a printing method. New materials opened up new methods which added to the scope of the silk screen process. In 1925 the Federal Art Project of New York opened up a poster division which designed and printed silk screen posters for the various departments of the project. The outgrowth of this experimentation resulted in the nation-wide recognition of the silk screen process as a fine arts medium and was accepted by the museums of the country as a medium in the same classification as etchings, wood engravings, woodcuts and lithographs. See *Silk Screen Process,* Earle Dowling; *Silk Screen Methods of Reproduction,* Bert Zahn; *Handbook of the Silk Screen Printing Process,* Harry Summer and R. M. Andrieth; *Silk Screen Printing Process,* Biegelisen & Busenbark; *Silk Screen Process Production,* Harry Hielt; *Silk Screen Color Printing,* Harry Sternberg;

**sill.** The lower horizontal side of an opening.

**silver point.** This as a drawing instrument was probably developed from the ancient stylus along with points of copper, lead, and gold. In order to work as a drawing instrument it has to be used on prepared paper, coated with a fine abrasive which will take off and hold small grains of the metal. The line of the silver point later corrodes to a darker, duller, and warmer tone. See also metal point. —G.L.S.

**simultaneism.** The simultaneous presentation of different views of an object in the same painting, and more or less superimposed one on another. A form of cubism and futurism (qq.v.) which appeared in 1912. It was soon rejected by the cubists in favor of synthetic cubism, but became an important principle of futurism since it contributed to their expression of dynamic movement. See FRENCH ART. —L.D.L.

**simultaneous scene.** See THEATRE.

**simultaneous seeing.** See PHOTOGRAPHY.

**sincerity.** See LITERARY CRITICISM.

**sinfonia, sinfonie.** See symphony; overture.

**single fabrics.** See weaving.

**single-warp knot.** The short length of wool is wrapped around only one thread of warp and the ends are brought forward to the surface, one on either side of the same warp thread, leaving one free warp thread between each two knots. Knots are tied on the alternate warp threads in each succeeding row. As in other weaves, after each row of knots has been tied, one or more weft threads are put in. This technique appears in early Spanish carpets which differ radically from that of the carpets of other lands. —B.E.J.

**singspiel** (Ger.). The German national form of the opera established by J. A. Hiller during the second half of the 18th cent. See opera.

**sinister side.** See HERALDRY.

**Sino-Indian art.** See CENTRAL ASIAN ART.

**Sioux art.** See Plains Indian art.

**sipapu.** Term used by the Indians of the American Southwest and applied to a small hole, cavity, opening, or pit in the floor of a ceremonial chamber. There are a number of various explanations given for this feature the most common among the southwestern Indians being that it symbolizes the opening through which the first people, their ancestors, emerged on their journey from the underworld to the surface of the earth. It is the belief of the Indians also, that through this hole comes the beneficent influences of the deities. (Also known by the names *shipapulima, shipapuyana, cibobe,* and *chapap.*) —J.M.M.

**sirventes.** See MEDIEVAL MUSIC.

**sitâr.** See MUSICAL INSTRUMENTS.

**site planning.** See CIVIC PLANNING.

**Siva.** One of the supreme deities of Hinduism, representing both the principle of destruction and the power of reproduction or restoration.

**size.** There has been a tendency to use this word for that type of animal glue which is derived from skins and bones. This makes it practically synonymous with gelatin. The word, glue, would then be applied specifically to the adhesive material obtained from cartilage and sinew. This is somewhat different because it contains chondrin. See glue. —G.L.S.

**sketching.** The process of developing an idea through drawing (q.v.).

**sketching easel.** See easel.

**skive.** *Book.* Paring or bevelling edge of leather.

**slab.** In masonry: Stratified or flat oblong stone, usually not over two inches thick; natural or dressed.

**slab system.** See terra-cotta sculpture, direct method.

**slant brush.** See CHINESE ARTS.

**slanting spot.** See CHINESE ARTS.

**slave narrative.** See AMERICAN NEGRO LITERATURE.

**slave secular.** See AMERICAN NEGRO LITERATURE.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**sleeve bands.** Narrow embroidered bands sewn on to the edge of the Chinese sleeve as a kind of cuff.

**slice.** A scraper, apparently used in former times to pick up paint from the grinding slab, carried this name. It was made of metal or of wood and was like a putty knife, though the scraping edge was often at an irregular angle to the sides and the blade was broader. —G.L.S.

**Slicha mode.** See JEWISH MUSIC.

**slip case.** *Book.* A case usually of cardboard to take a rare book and protect it from rubbing.

**slit drum.** See MUSICAL INSTRUMENTS.

**slittered arch.** An elaborate arch with much vertical detail achieved by the grouping of cusps and stalactites. See ISLAMIC ART.

**Slöjdförneningen.** See SCANDINAVIAN ART.

**Slovakia, art of.** See CZECHOSLOVAKIA, ART OF.

**slow seeing.** See PHOTOGRAPHY.

**sluck sashes.** See POLISH ART.

**slum clearance.** See CIVIC PLANNING.

**small axe stroke.** In Chinese painting, the technique of shading developed by the Northern School of the T'ang dynasty; i.e., shading by small strokes resembling axe splits.

**smalt.** Although literally one of the cobalt pigments, this dates from a much earlier time. Like them, it is an artificial compound, a potash silicate strongly colored with cobalt oxide and ground to a powder. There is some argument that it may have been known to the ancient Egyptians. As a dark blue color on the palette of the painter, it has not been located in European pictures earlier than the 15th cent. and it was at about that time when certain cobalt minerals were discovered on the borders of Saxony in Bohemia. Like the other cobalts, it is permanent but, unlike them, has a weak tinting strength and poor hiding power. It will not keep its color with extremely fine grinding. Its weakness probably led to its displacement by the much stronger Prussian blue in the 18th cent. —G.L.S.

**smashed.** See edition binding.

**smoking.** *Etch.* A specially constructed taper is used to smoke the hard ground used in line etching. The melted hard ground combines with the lamp black from the taper to form a black surface on which the drawing is easily seen. —K.K.

**smooth calf.** *Book.* A plain calf binding without decoration.

**S motive.** The S curve. Commonly used as a unit of design in East Asiatic art.

**Smyrna morocco.** *Book.* An imitation morocco from a sheepskin split and grained.

**Smyrna rugs.** See ISLAMIC ART.

**snake.** See SYMBOLISM IN FAR EASTERN ART.

**snare drum.** See MUSICAL INSTRUMENTS.

**snuff bottles.** Small decorated bottles of various materials. Each bottle has a stopper to which is attached a tiny spoon for dipping out the snuff.

**soak.** *Cer.* Soaking period. Heat is held and given time to penetrate ware. See CERAMICS I.

**soap-rock.** See CERAMICS II.

**socialist realism.** Theory of art developed in the Soviet Union. Art is conceived of as an aesthetic reflection of reality, good to the extent that it is faithful to the reality. To be faithful, however, is not to be photographically realistic. It is held that photographic realism renders things statically, as they might seem at some motionless moment if there were any such moment; it does not render the movement and development of things. Dialectical materialism is held to be a philosophic theory which directs the attention of the artist and the critic to the fact that nothing is static. Hence it is necessary to deal with a given subject in such a way as to render its future implicit in its present, to see the subject as a developing entity. This development, of which the essential factor is a conflict of opposing elements, is seen to involve, in social fields, the transition from capitalism to socialism and the further development of socialism into communism. The socialist element in the realism is therefore indicative of the direction in which social subject matter is considered moving. Socialist realism, accordingly, is not essentially

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pessimistic, but optimistic, and involves a "revolutionary romanticism", which depicts the many-sided devotion of human beings to social ideals, and the richness of emotional and psychological content which is generated in the struggle for such ideals.

In the field of literary criticism (q.v.) socialist realism sets before itself the task of overcoming what it considers the mechanical narrowness of earlier tendencies in the Soviet Union and elsewhere; tendencies which are characterized as vulgar sociologism (q.v.). These tendencies are criticized as attempts to "explain" art by relating it to the class consciousness of the author and reducing it directly to sociological forces. Socialist realism holds that a genuine class analysis of art, which should be made, consists in investigating the relation of the objective content of the art (not the subjective consciousness of the author) to the course of the class struggle. It is considered that if the art reflects social reality faithfully (however indirectly, symbolically or fancifully) it will reflect the class struggle as a central part of that reality. The view taken is that the class significance of a work of art—in the sense of what it reflects and also how it affects the further course of class struggles—may have nothing to do with the personal class membership or consciously held social viewpoint of the author. Lenin, for example, in his essay on Tolstoy, points out, in opposition to the narrower view, that Tolstoy, himself a noble, nevertheless presented some of the best pictures of the Russian peasant in all literature and depicted with powerful reailsm the social content of his times and the forces that contributed to the revolutionary dénouement in Russia, in spite of the fact that his consciously held philosopry rejected the whole idea of the revolution. Balzac, by conscious belief a Catholic and a royalist, is likewise evaluated as an artist of great genius in virtue of his faithful portrayal of a social reality which actually led, it is considered, to results quite contradictory to his own views. Moreover, while the sociology of art, properly approached, is considered of great value, it does not exhaust the philosophy of art; the latter should include, it is held, an aesthetics of art in which the specific qualitative richness of artistic productions must be accounted for in aesthetic terms, in terms of the analysis of forms of beauty and of related problems, such as the perennial appeal of "classics." These problems are not felt to necessitate a non-historical methodology. On the contrary, it is considered that they can only be solved within the changing frame of reference of the life of social man.

**socially-conscious art.** A term used in contemporary American art criticism to describe painting or sculpture which consciously employs social maladjustment as a theme, e.g., poverty, unemployment, the hardships of labor, strikes, class warfare, capitalist greed, religious strife, militarism and the disasters of war, etc. Frequently it supports socialist or communist doctrine and is disillusioned, satirical, and propagandist in nature, though at the same time it is often dramatic and of high artistic quality. Orozco, Rivera, and Siqueiros in Mexico are good examples of socially-conscious art, as also, in varying degrees in the United States, William Gropper, George Grosz, Mervin Jules, Mitchell Siporin, and the various artists who were employed by *The New Masses.*

The term was used frequently in the 1930's, at first commonly in a derogatory sense. It gradually lost its precise meaning and rather deprecatory connotation, as in increasing numbers American artists were influenced in their work by social conditions. At present it has nearly lost its value as a term, since it cannot usefully be defined so broadly as to include all contemporary painters of the streets and back yards of city slums, the Louisiana bayou shacks, Georgia "jungles", and Oklahoma dust storm ruins, in most of which neither satire and irony, nor the artist's political convictions are evident.

The term has never been employed to designate socially conscious artists of fascist inclinations, or artists who, in a more casual way, are aware of and influenced by the society in which they live. —L.D.L.

**sociological aesthetics.** See AESTHETIC INQUIRY, CURRENT TYPES OF.

**Sociology of art.** That science which investigates the interaction between art and the social life-process. It studies the dependence of the forms and subject matters of art works on the basic structure of society, just as it examines the meaning of art works for the sustaining and overthrowing of given social conditions. The social role of art varies from time to time. The same art work will take on a new meaning for each succeeding generation, in each new historical period. A Greek temple has an appearance in classical Greece wholly different from that in the Christian Middle Ages, the Renaissance or

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in the Counter-Reformation. The sociology of ruins is quite different from the sociology of a sanctuary.

As a distinct cultural realm art is a product of the social division of labor. Among primitive tribes rhythm, song and work constitute a continuous whole; singing is at once the expression and conciliaion of the pain of toil. The first paintings were probably made to keep away the dead, whose spirits men dreaded. Even during periods of advanced cultural development, such as the Middle Ages, art was not dissociated from ritual and secular practices. Religious paintings and cathedrals were not viewed aesthetically any more than furniture and clothes. The former served material or religious ends, not to mention social prestige.

Just as primitive artistic expressions are attempts to mitigate the pains of toil and death through their representation so does later art contain the reaction of men to the constraint of social reality. Art works mirror the world in the light of man's undiminishing claims for happiness and growth; they objectify those experiences which have not yet been set forth in everyday language or schematized. In everyday life human reactions, thoughts and feelings are oriented by practical ends; in the last analysis, by the existing modes of production. Men perceive the world in terms of concepts enforced and born of current practical needs. An art work, however, reflects reality in a way strange to and different from the practical. What appears as necessary and absolute in the practical world is revealed through art to be contingent and relative.

Not only are the critical literary works which appear some time before great historical changes antagonistic to the goals of the practical world, but even so are those works which were intended by their authors as glorifications of their own society. The tendency to be outspoken is only—and in no way the most important element of an art work on which the sociologist of art focusses his analysis. The ideality and harmony of the goals toward which a musical composition or poem seeks to transfigure the world can be judged from the intrusiveness, the determined singleness of purpose, the tender attention to the momentary, the thoughtfulness attended each minute detail, the measure of freedom given the part which is nevertheless kept bound to all the other parts,—these are ever so many tugs which signal the tension between the art work and reality. Hence the formal elements, just as much as contents or outspoken theses of art works, have sociological relevance.

Sociology of art is to distinguished from psychology of art. Balzac, for example, was a royalist and many of his works contain an absolutistic credo. Yet his works, if for no other reason than the skill with which they portray the deep emotions of men from all walks of life, are just as liberal and democratic as the works of the republican Victor Hugo. Sociological analysis strives for insight into the objectice relationship between art works and social reality. From this point of view, the psychology and the fate of the artist constitute only aids to sociological understanding.

Likewise, the association of art works with individual social groups is one of the tasks of sociology of art. This task includes an examination of the style of art works, of its characterizing views and thoughts; it is an investigation into what past and present strata of society particular art works are in fundamenal accord with. It is possible that sometimes an upper middle class artist produces lower middle class, aristocratic or proletarian works of art. Now this gathering together of detached facts into a single confirmation has its purpose insofar that without a sociological identification of the aforementioned thoughts and views there will be neither comprehension of the art work in question nor will the social reality of the art work be fully disclosed. What is decisive, however, is that these social elements unite in each work of art into a single structure which actually throws a new light on the present.

The ultimate object sought for in sociological analyses of art works is the power of insight of the latter, the ability of art works to make society intelligible. The historical effectiveness of art objects does not lie solely within this capacity of great works of art to give insight into social processes. Sociology of art is also concerned with the negative functions of the aesthetic. It shows that the independence of art from the world of practical ends is, for the greater part, only an appearance and discloses the agreement between art and social power in all its ramifications. From the role of art as an hypnotic tool in the hands of the primitive sorcerer to its crafty use by modern authoritarian cliques constitutes, as it were, a history of the dark or sinister aspect of the aesthetic. This dark side of the aesthetic extends not merely to those instances in which art consciously serves

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

some purpose but especially to the distortions of the world to be found in the aesthetic realm, such as are to be found in works reflecting the appearance of the world to different periods and classes. In these instances art has helped to consolidate the obsolete, to prolong injustice, and to usher in oppressions.

The social role of art is no more amenable to all-embracing principles of explanation than are other cultural phenomena. Furthermore, the boundaries between philosophy of art, aesthetics (*Kunstwissenschaft*) and sociology of art are in many instances not to be sharply drawn with any significance. Fundamental even today for sociology of art are the great philosophical treatises; e.g., all of Hegels' lectures on aesthetics, the writings of Spencer, Comte, Max Weber, and Georg Simmel. Among the few works which are exclusively devoted to sociology of art the book by M. Guyau, *L'art au point de vue sociologique,* who was a student of Durkheim, has played an important role. The works of Eduard Fuchs give extensive sociological view of art are contained in the many monographs on the history of art. Mention should be made of the works of Doorac and Alois Riegl. To these should be added all general works in the fields of sociology and anthropology. —M.H.

**soda-lime glass.** See GLASS AND GLASSMAKING.

**sofa.** See FURNITURE.

**soffit.** The ceiling or underside of any architectural member.

**solvent.** Any of the volatile, fluid, organic compounds which, without chemical change, make a solid material into a usable fluid are eligible to be called a solvent. In the arts these are used largely in varnish making and in the removal of varnishes from pictures. The gums, like gum arabic used in water color painting, are dissolved in water and so are glues and size. —G.L.S.

**Soma yaki** (Jap.). Pottery made in Iwaki province.

**sonance** (*adj.* sonant). That aspect of tone quality which results from fluctuations in pitch, intensity, time and timbre from wave to wave within a tone (see acoustics, terminology in). We do not hear the quality of a single wave. It requires a succession of waves to give us the experience of tone. What we do hear is a sort of average pitch, intensity and timbre, the result of a succession of changes in the structure of a tone from wave to wave. This we call *sonance.* While timbre gives us a cross section of a tone, sonance represents the body of a tone as a whole for the period of its duration.

With laboratory instruments we can produce a complex sound in which the harmonic structure of the sound waves remains constant for any length of time. In that case the timbre for one wave furnishes a complete description of all the waves, and, therefore, of the tone as a whole, because it is uniform. But such uniformity rarely occurs in music. In practically all musical tones, both vocal and instrumental, there is a continuous flux in the structure of the tone; i.e., the spectrum (q.v.) changes from wave to wave. The result is a fusion of all these changes, a sort of average timbre, pitch and intensity, which may be represented as a tone-band with fringes. As timbre represents simultaneous fashion in one spectrum, i.e., for one wave, so sonance represents successive fusion of changing timbre spectra, pitch and intensity.

The term *sonance* was coined in the University of Iowa Psychological Laboratory in the attempt to describe the phenomenon of vibrato (q.v.) which is one of the large variables in the quality of a musical tone. Since then it has proved an essential concept for the understanding and description of any musical tone and, when once understood, should be as familiar to musicians as is its companion piece, timbre.

The performance score (q.v.) shows that a musical tone is complicated and unstable in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

structure. When measured with precision, a graphic picture of the tone shows not only unsteadiness in pitch and intensity of the tone as a whole but also a complicated flux representing periodic and progressive, as well as erratic, changes in the pitch and intensity of each overtone as well as the coming and going of accessory and inharmonic factors. All of these changes can now be measured and expressed quantitatively. This is an important forward step in the scientific approach to music. Thanks to phonophotography (q.v.) we can now describe adequately any particular musical tone in terms of the timbre as representing a single cross section, and the sonance—the progressive changes in timbres from wave to wave throughout the tone.

Tone quality has always been a very vague and airy term for which music has dozens of ill-defined terms and only rarely any scientific concepts. With the coming in of phonophotography in the last 25 years an entirely new situation has been created in the field of musical acoustics. Musical sounds have been taken into the laboratory where they have been analyzed, measured, classified and explained in rigid scientific terminology which may have musical connotation. The result of such measurements is that in the psychology of music we can now talk about tone quality with the same sort of certainty that we could talk about the structure of the ear or the velocity of sound. The subject is approached by means of phonophotography and the result of measurements show that tone quality has two components, namely, timbre (q.v.) and sonance.

On the basis of the above considerations, I recommend that musicians scrap their whole repertoire of synonyms for tone quality. The diversity of words simply adds to the confusion. "Tone quality" is a term which is adequate and clearly defined, and has the same meaning in music and all the sciences dealing with tone. When we wish to distinguish between its two aspects, a cross section of the tone and the whole tone, we have the two adequately defined terms, timbre and sonance; but for most musical purposes in daily use, the generic term, *tone quality,* should be used in the technical sense of *sonance.* See C. E. Seashore, *Psychology of Music,* 1938; and *In Search of Beauty in Music,* Musical Quarterly, 1942. —C.E.S.

**sonata.** The sonata formula, as crystallized in the 18th cent., provided a plan for greater contrast than the fugue had prescribed and for more extended development of ideas. The term is first found in the last part of the 16th cent. (e.g., in *Sacrae Symphoniae,* Joh. Gabrielis, 1597). It is believed that its early use was merely in the sense of "music to be played" as distinct from "music to be sung" or as distinct from closely related instrumental forms such as the *canzona* which retained certain vocal characteristics.

Considerable strides towards the sonata form were made by the Mannheim school. The so-called classic four-movement form, however, is that of Haydn and Mozart. In their sonatas the plan of the first movement is most characteristic. The last movement normally either conformed with the first movement plan or it was based on the rondo form which involved several simple statements of a main theme interspersed with digressions. The other movements often derived their plan, without very great alteration, from the suite. Haydn, however, had a particular attachment to the variation form as a basis for his slow movements. While the term sonata was normally confined to works for solo instrument, or for solo instrument with piano accompaniment, the sonata formula was used as well for trios, quartets, symphonies, concertos, etc.

It is possible to attach too much importance to the specific devices of the sonata pattern, and too little to the principles behind it. The first movement plan of the sonata provides a point of departure for a composer who wishes to achieve certain ends that might also be achieved with a somewhat different plan. If composers accepted the general pattern it was because it embodied a suitable principle of limitation, and limitation is important to the creative process. Limitation is not, however, an end in this process, but rather a means. The time spent inventing novel patterns would be time lost on the means, when the full absorption should be in the end.

It is commonly said that the exposition of a sonata presents two contrasting themes, motive, or ideas. Tovey, however, insisted on the recognition of the fact that the greater sonatas present many more than two ideas of more than transitional status. The ideas tend to fall into two groups, in each of which one thematic element is often primary. A brief pause often discretely separated the groups. In this aspect there is a rather significant difference from the ever-going-on-ness of the dove-tailing sections of the fugue.

If the contrasting groups, in one respect, satisfied the principle of variety, the principle

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of unity was maintained by means of a close key relationship: that of the fifth above the tonic (the so-called dominant) or, if the opening theme was minor, that of its relative major towards which minor intrinsically tends. (See scales and modes.) The composer then was limited in two useful ways. He was checked from over-indulgence in a single idea, and he was prevented from using up in advance, and thus weakening the impact, of the modulatory expansion of the development, or middle section. Thus, the striking impression of the middle section is not simply due to the drama of rapidly changing key suggestions and the more complex relations in general, but to the perception of certain thwarted appetences suddenly let loose towards a harmonic goal. The so-called recapitulation restores the initial state with certain modifications. It may be true, as it is often surmised, that the restatement of the second group in the main, rather than in the dominant key, is in order that the final cadence in the main key may be prepared sufficiently well in advance. The extended codas of many Mozart and Haydn movements would seem to obviate such a necessity. The limitation, however, is worthwhile, in so far as it keeps the composer from the easy way of literal repetition of the beginning. A new transition must be made between the two groups, since the relationship is somewhat different.

Characteristic of the first movement form is the rapidity with which it moves from one idea to another. This is especially true in the development section where motives, derived from the longer main themes, are mainly dealt with. But even the longer themes of the exposition move directly into transitions by means of extension, and are often immediately decomposed into transitory developments. The posthumous B-flat major sonata for piano of Schubert is weak in the way it lingers for some forty measures over the opening theme, repeated twice with meagre modification. The composer manifests a lack of control in not being able to resist his immediate infatuation with an admittedly pleasing theme. In preoccupation with the detail he loses the large view of the sonata form whose excitement lies in the rapid drive towards the development which realizes the implications of the themes. The weakness is not simply failure to adhere to a conventional requirement. For the practice of presenting a fact and immediately commenting upon it is obviously a more significant procedure than the mere statement and restatement of a fact.

The contemporary use of the term sonata often derives from the earliest general historical sense of music "to be played." Even where there is a more literal adherence to the scheme, the key requirements are often adapted to a more modern tonal structure. See Chamber Music. See *Essays in Musical Analysis,* vols. I-II, Donald Tovey, 1935; *Musikalische Formenlehre,* Hugo Leichtentritt, 1927. —A.V.B.

**sonatina.** A little sonata (q.v.).

**SONG.** NATURE. Song, basically, is melody. In music, it means a composition combining words and a melody. Although epic and dramatic songs exist, the most typical elements of song remain lyricism and relative brevity. Song seeks an aesthetic effect through pitch inflection. This, in its most primitive form, is the gliding intonation of the sounds of nature and the indefinite pitch-points of emotionalized speech. Melody must be present in all song as must also motion in the pitch range. (Texts such as the *Monotone* of Cornelius, avoid this motion.) Harmony and meter are present in practically all art-songs. Song melody, further, is characterized by a predominance of diatonic progression (the essence of melodic relationship among tones) and the relationship between diatonic and skip-progression is one detriment of a composer's song style. In song, the procedure is seldom from music to poetry; in almost all cases the poetry inspires the music, since word language is familiar to all composers. The reverse procedure, however, is artistically quite possible, provided that the poet is sufficiently trained in musical perception. (In the period preceding the Middle Ages, poets frequently were also musicians, thus, the troubadours.)

FORMS. Song may be classified in many ways, but the elements of any one class will overlap those of some other class; on the basis of musical merit (art-song, popular-song); simplicity (art-song, folk-song); application (love-song, dance-song, work-song, drinking-song); secular or sacred content (folk-song, hymn); tone-text relationship (word-song, mood-song); stanza construction (strophic, non-strophic); accompaniment (unaccompanied, accompanied, a capella).

**Art-song** (It. *canzone*; Ger. *Kunstlied*; Fr. *chanson*). A song meeting the requirements of musical and poetic art. Usually written by composers of note to good texts, with

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

interesting, appropriate, and individual accompaniments and with the melodic line, except for occasional short phrases, not paralleled by the accompaniment. If the accompaniment or melody attempts to depict the meaning of individual words or phrases we have word-setting; if it projects merely the basic mood of the text (as in strophic-song) we have a mood-setting. Most art songs contain elements of both.

**Folk-song** (Ger. *Volks-lied*; It. *canzone folkoriana*; Fr. *chanson*). A song of and for the people, consisting of simple melodic, harmonic and metric elements. Strophic, with the melody usually duplicated in the accompaniment. Traditionally of obscure origin with composer unknown, sometimes set by composers (J. A. P. Schultz, *Lieder im Volkston,* 1782; Foster, *Swanee River*). Text expressive of obvious sentiments. Also one form of ballad. Folk-songs, in English-speaking countries, are in major keys, in Russia, Spain, Balkan countries and others, many are minor. To this class belong also the *"volkstümlich", "volksmässig",* folk-like, songs by many composers.

**National song** (national anthem or hymn). A song in the folk-song idiom with the text restricted to national, usually martial themes. (*Star-Spangled Banner*; France: *Marseillaise;* Germany: *Deutschland über Alles*; Austria: *Gott erhalte Franz den Kaiser*; Italy: *Marcia Reale*; Russia: *God ever Glorious.*)

**Popular song** (Ger. *gassenhauer* [street hit]; It. *canzone poplare*; Fr. *chanson populaire*). A song of the people, of trivial musical and poetic value, written for immediate popular consumption, usually by laymen. Similar to some of the English ballads.

**Strophic-song.** A song (folk—or art-song) in which each stanza is set to the same music. Such songs necessarily belong to the mood-song class. (Schubert, *Ave Maria*; Schumann, *Marienwürmchen*; Brahms, *Sonntag*; and many *Bergerettes.*)

**Non-strophic song** (Ger. *Durchkomponiertes Lied*). A song in which the music varies with the meaning of each verse. (Schubert, *Erlkönig;* Schumann, *Die beiden Grenadiere.*) It usually combines word and mood elements. When long dramatic texts are used it approaches a form of "ballad" or tone-poem in which the simple lyric element may be all but lost. The "ballad" song differs from the operatic aria in a closer adherence to the text.

**Ballad** (Ger. *Volkstümliches Lied;* Fr. *chanson*; It. *ballata*). (a) A style of song long used in England and derived from *ballata,* a song with dance. It is roughly equivalent to the popular song, sharing with this the binary-form: verse-with-refrain, or verse-with-chorus. (Such a division is characteristic also of the larger recitative-aria form.)

(b) An extended song composition of serious, usually epic content, non-strophic in character and with descriptive and detailed accompaniment. In this form the ballad becomes the highest and most complex type of song composition. (Schubert, *Erlkönig*; Wolf, *Mignon*; Loewe, *Eduard Ballade.*)

**Plain song.** The unisonous vocal music of the early Christian church, based upon poetic meter rather than musical meter. Not a form of "song" as this is understood in music.

HISTORY. Song, as vocal expression, originates in antiquity. Folk-song, especially in its rudimentary form, has accompanied human life as call motives, burial chants, or work-songs in even the most primitive tribes. The earliest songs were unaccompanied and in a single part. During the Middle Ages song received an impetus from the troubadours, minnesingers, and Meistersingers, and we meet such names as *pastourelle, canzona, lied, lei, spruch, romance.* Adam de la Hale's pastourelle, *Le jeu de Robin et de Marion* is a very early collection of French folk-songs. Toward the end of the 12th cent. other parts were added to the original part. The absence of a sufficiently specific system of notation necessitated oral transition of songs; as a result the original forms are obscure. However, song as we generally understand it, did not develop as an art-form until the 14th cent., with the development of instrumental accompaniment (see madrigal). Naturally, when the monodic reforms of 1600 took place they had to include song in its broad meaning, since song is in its very nature monodic. The decadence of song in the 17th cent., asserted by some authors, is merely relative. With its folk-song basis it had already spread into all countries but was then obscured by the rapid and more commanding forms of the oratorio and opera, and the simultaneous development of instrumental music. (This difference between the cultivation of one monodic form and not the other remains an interesting musicological topic.)

Caccini set a series of short poems to instrumental accompaniment in his *Nuove Musiche,* which represent early types of song. In 1570, Antoine de Boif founded an Academy of Music and Poetry in France. The aim

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of these early songs was to free the melody from slavish metric imitation of verse, and to lend greater expressiveness to the melody. About this time Heinrich Albert (1604-1651) published eight volumes of "arias" using the choral and dance-song as basis, and giving a hint of the later non-strophic song. In England collections of solo-songs in ballad and folk-song style appeared as early as 1600 (Morley, Byrd, Dowland, Campion). During Queen Elizabeth's reign, trade and work songs were widely used. To this general period belong also such *"volkstümliche"* songs as *The Willow Song* and *Greensleaves*. At the same time occurred a transition from the old modal system to the modern major and minor tonalities. Collections of *Ayres and Dialogues* were published. The period reached its climax in the songs of Henry Purcell (1658-1695). The English folk-song idiom continued into the early 19th cent. (*Home, Sweet Home; Blue Bells of Scotland*).

No other art form has been more closely adapted to the "Weltschmerz and Wanderlust" of Germany than the song, and the simultaneous appearance of the great poet Goethe and the great composer Schubert in the early part of the 19th cent. formed a combination which brought the art song to one of the highest points it has ever attained. The outstanding position which Schubert (1797-1828) holds in this field results from a well-nigh perfect adaptation of his talent and personality to the song form, and to equally favorable developments (early Romanticism) in the history of music. What had happened in the field of operatic song and aria, cantata and other vocal works, together with the piano as an accompanying instrument, and the presence of excellent poetry gave rich opportunity for the expression of his genius, which embraced all song types from the folk-song to such epic ballads as the *Erlkönig* and *Gretchen am Spinnrade*. Moreover, Schubert had no contemporaries who equalled him and the more than six hundred songs he wrote, very few of which are mediocre and many of which are great, not only gathered the various preceding tendencies, but at the same time established art-song on a level which has never been actually surpassed. (The songs of Haydn, and Beethoven, although musically very valuable, did not affect the history of song.) Mozart in *Das Veilchen* wrote what is usually considered the fine art-song. The *volkstümlich* type went on with J. A. Hiller and J. A. P. Schultz. In England, the light ballad form continued; in France, song took on a more nationalistic, patriotic hue, and in Italy, monody flourished chiefly in the operatic aria.

Robert Schumann (1810-1856) added a characteristically reflective, dreamy mysticism, or subjectivity to the song, drawing on such lyricists as Heine, and forming a link between the more clear-cut objectivity of Schubert and the complex tone-paintings of the later period of composers, H. Wolf and others. In the Schumann vein, but at lower artistic levels are the songs of Abt, Jensen and Franz. The songs of Brahms bear the stamp of his individuality and have thus further enriched the literature. In his *Vier Ernste Gesänge,* he gave to the world examples of spiritual, subjective song which have never been surpassed, if even equalled in value, and which had no predecessors in song literature.

In the meantime the "ballad" or narrative type of song had been given an initial impetus by Johann Zumsteg (1760-1807), and later served for the rich and dramatic ballads of Carl Loewe (1796-1869). This form is furthest removed from the original short, lyric content of song and actually becomes a short "tone-poem" for voice and accompaniment. It applies to song the dramatic principles of Monteverde and Gluck, and it contains elements of both recitative and aria. Such ballads are essentially non-strophic, gaining unity through thematic development by means of the leit-motiv principle. (The use of the word "ballad" is very misleading, since this originally, and even today, in its popular connotation is just the opposite. See ballad A. Song-poem would be much more appropriate.)

Once the close association of word with music was stressed, later songs frequently carried this narrative element. In the songs of Hugo Wolf (1860-1903) we find many passages resembling the speech-song of Wagner. Moreover, there is a better choice of poet, and Wolf composed entire cycles on texts by Möricke, Goethe, Eichendorff, and translations from the Spanish. In its very nature, song must be a duo between word and tone. In Italy the relative absence of lyric poetry was accompanied by a relative dearth in song composition, with the Italian fondness for melody finding expression in the operatic aria. In France the escape from the light *chanson* (latter part of the 19th cent.) came with the development of art song elsewhere (Faure, the French Schumann), and with the advent of the impres-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sionistic poets Verlaine and Mellarmé and their contemporary composers Debussy, Duparc, Chausson. (Debussy, *Ariettes oubliée* to Verlaine, *Cinq Poemes* to Baudelaire.) Of all art forms, the short song lends itself best to the *pastelles* of the impressionists, and these French songs have contributed a charming, and colorful type of song literature. Debussy, with his whole-tone scale, began this distinctive coloration.

The poet-composer associatior is also reflected in the songs of the Scandinavian, Grieg (1843-1907), set to poems of Bjornson and Ibsen, and marked by typically national melodic and harmonic progressions.

In Russia, Glinka (1804-1857) may be credited with founding the art-song. He and his followers (Balakirev, Cui, Moussorgski, Rimsky-Korsakoff) adhere to dramatic verity, using the traditionally sombre Russian hue, and rich harmonization. Once again, the composers use the poems of the best writers, Pushkin, Turgenev, Dostoevsky, Tolstoy.

Similar nationalistic styles were developed in other countries: Spain and the Balkans. In Spain the charming lighter forms have been widely used, the art-forms much less, until recently.

At the same time, the more cosmopolitan song-style of Schubert, Schumann and Brahms continued to exist in the songs of Rubinstein, Tschaikovsky, Rachmaninoff, R. Strauss, Marx, Mahler, and others. To this style belong also the songs of English (Bantock, Delius, Quilter, Scott, Vaughan Williams) and of American composers (Stillman Kelly, Huss, Buck, Beach, Cadman, Chadwick, Hadley, Macdowell, Griffes). In the U. S. A. an original color has occasionally been added by the use of Indian and Negro tunes, but the essential characteristic remains an eclecticism, the sources of which are drawn from European origins.

Recently, in England, an attempt has been made to write unaccompanied song (Herbert Bedford). A single vocal line portrays the text, with close attention to pitch inflection and agogic freedom in the onomatopoeic aspect of the words. As an art-form this style is limited; any gain in word-tone integration and freedom of pitch outline is offset by the loss in rhythmic vitality and in harmony. Moreover, unaccompanied song places burdens of musicianship and intonation on the singer which few vocalists can carry.

Nor has the twelve-tone technique added materially to the history of song (Schönberg. Krenek, Van Webern, and others). Some songs have been written in this idiom which are musically valuable. Their meagre acceptance is not a fault of the system itself, but rather of the vocal and musical difficulties which they impose upon ill-equipped vocalists. —O.O.

**song-form.** *Mus.* A simple form of three sections, the third being a repetition of the first (a, b, a).

**song play.** See opera.

**sonorous stone.** See MUSICAL INSTRUMENTS.

**sordone.** See MUSICAL INSTRUMENTS.

**soritsuno** (Jap.). Small hook in the side of of scabbard to prevent the scabbard from being pulled through the belt when the sword-blade is drawn.

**sorrowing Christ.** See ecce homo.

**Soumak or Cashmere rugs.** An abbreviation of Shemakha, the name of the town in the Caucasus where this weaving is done. It is a rug of three members—warp, weft and stitch. The stitch is flat woven with a needle on the warp, making an oriental rug weaving with a smooth surface. The distinguishing feature of this weaving is the long loose ends of stitch yarn at the back of the rug, as at the back of Cashmere shawls. Their surfaces are compact with rows of stitches, sometimes twenty to the inch, perpendicular, and the numerous long threads at the back act as a buffer between the back and the floor. —B.E.J.

**sound.** *Motion pictures.* Consists, in the film, of speech, natural sound, and music. Although speech and sound are used most frequently in conjunction with their visual sources, as in the theatre, many theorists and practitioners, such as V. I. Pudovkin, contend that speech and sound should not be used merely to duplicate and supplement the effect of the visuals, but may be removed from their visual source and superimposed upon some action to which they are related only thematically, e.g., the speech of a character may be laid over images or action which present a parallel or an ironic contrast to the sense of what is being said. This *contrapuntal* use of sound applies also to music, which may either represent literally the effect of the visuals (as is customary) or develop an independent succession of ideas and sentiments. —I.B.

**SOUTHEASTERN ASIATIC ART.** Burma, Siam, (Thailand), Cambodia, and Campā derived their artistic stimulus from India, both directly and indirectly, in the latter case influencing each other and being influenced by Ceylon, Sumatra, Java, Malaya, and China. All of the earliest statues were made by Indians, some of them evidently in India, and the construction of many of the buildings must have been at least supervised by Indians. Paintings are scarce and there is a paucity of inscriptions and other literary evidence. All the art is religious and communal: no artist's name is known.

**Burma** is on the Irawadi River. Not much is known about it before the 10th cent., except that the Pyus had their capital in the north, at Prome, and the Talaings had theirs in the south at Thaton. Markedly Indian ruins have been found near Pagān, which became the northern capital in the 9th cent., after Prome had fallen before the independent southern kingdom of Pegu.

In 1056 King Anawratā (Aniruddha) of Pagān, being displeased with the Tāntrik Mahāyāna Buddhism practiced by some of his people, requested King Manuha of Thaton to send him priests and texts for the dissemination of Hīnayāna doctrine. Manuha's refusal caused Anawratā to attack and conquer his kingdom with exceedingly important results. Hīnayāna supplanted Mahāyāna in Upper Burma, Pāli replaced Sanskrit as the scriptural language, and the people adopted the Talaing (Mon) alphabet and wrote their own language for the first time. The subsequent unification of Burma by Anawratā inaugurated two centuries of building that finally left Pagān and vicinity with remains of over 5000 religious structures, some in stone, but most in brick decorated with carved stucco. Nearly all show Indian affinities. The Ngakye Nadaun, for example, is reminiscent of Sārnāth, the Mahābodhi is almost a copy of Bodhgaya, and even the most distinctively native types, such as the Ānanda and the Hindu Nat Hlaung Gyaung, with a high, cubical base with openings in the sides, have a precursor at Mīrpur Khās, Sind. Certain ones, like the Mingalazedi and Shwesandaw, recall the terraced temples of Cambodia and Java (Borobudur), and others refer to Ceylon and China.

At least until the 11th cent., Burmese sculpture is too Indian to require independent consideration. The reliefs of the Ānanda pagoda (1082-1090) appear more self-sustaining and are both charming and lively. They represent scenes from the life of the Buddha and, unlike reliefs at Ankor and Borobudur, are not continuous. Several temples contain glazed *Jātaka* bricks, which are closer to the Indian style.

Fresco paintings are found in various temples, some very competent, all close to India (Bengal and Nepāl).

Burmese bronze Buddhas after Bengal and Bihār models are noteworthy mainly for their influence on northern Siamese sculpture.

While the strength of the people had been sapped by such great expenditures on building and related works, Kublai Khan sacked Pagān in 1287. The subsequent incursions of Shān-Thai (true Burmese) people and the struggles between the Shān and the Talaings further vitiated the productive impulse, so that there was a rapid decline in the quality of artistic production, coincident with the diminution of direct Indian influence. By 1760 the Burmese had gained complete control, and the only significant later works are several groups of monasteries reminiscent of earlier, extinct Indian wooden buildings; the Mandalay palace of Mindon Min; and illuminated Buddhist texts prepared for him. These latter are of palm leaf, decorated in red and gold lacquer with writing in black. In soaring modern pagodas, like the Shwedagon in Rangoon, the exterior definition of the different architectural elements has been sacrificed for a sensation of aspiration, with the result that structural composition has been supplanted by rather insipid attenuation.

What has in the West been known as **Siam** and is now called **Thailand** was neither settled nor controlled by the Thai (Siamese) until the 13th cent., but different parts of the territory, under various leadership, were centers for the production of objects of art.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Most of these centers were on the Menam River or its tributaries. The earliest objects found are bronzes of the **Amarāvatī school** of India and the base of a temple that is purely Indian. Nothing is known about this period. The first historical facts come from records of Chinese pilgrims, who refer to a kingdom of Dvāravatī existing in the 6th or 7th cent. between Burma and Cambodia. The people were Mons, related to the Talaings of Lower Burma, their inscriptions were in Pallava characters analogous to those of pre-Ankorian Cambodia, and their architecture and sculpture were markedly under the influence of India of the Gupta Period. From the stupa at P'rapatom, which has been too much restored to be of historical value, come some of the earliest pieces of sculpture. They are a stone Wheel of the Law (q.v.) and deer, survivals of abstract representation of the Buddha. The statutes of Ardhānarī and the *Yaksi* from Srīdeb may be Funanese (i.e., before Mon or Khmer ascendancy) and in any case hark back to considerably pre-Gupta Indian prototypes. The main output of the Dvāravatī Period, however, was a number of Buddhas in bluish limestone having heavy curls, high arched eyebrows, and an asexual body showing through a double monastic garment. These are definitely related to the Gupta sculpture of Sārnāth.

The kingdom of Srīvijaya or Jāvaka, in the Malay Peninsula, was apparently contemporary with the kingdom of Dvāravatī and produced both Hindu and Buddhist architecture and sculpture, some of which is indistinguishable from Indian monuments of the Pāla Period, and some of which has affinities with that of Java, Dvāravatī, and even Campā. Large bronze representations of Lokeśvara and Padmapāni are among the finest pieces produced in Siam; although they are quite Indian, their material seems to indicate a Srīvijayan origin.

The **school of Lopburi** (**Labapurī**) came into being with the Khmer (Cambodian) dominion over Siam, from the early 11th cent. to about the middle of the 13th cent. Although Hinduism and Buddhism of both kinds existed side by side, as witnessed by the buildings, nearly all statues are Buddhist. The buildings of the period are typically Khmer with little or no local (Mon) influence, whereas the sculpture varies from pure Khmer to Mon-Khmer to Khmer-Thai. The Khmers did not take kindly to the native blue limestone, but preferred the sandstone to which they were accustomed, and bronze. Generally speaking, the statues had eyebrows raised like ledges, acutely arched noses, jutting chins, and a decidedly marked outline to the hair. In the seated figures, an idiosyncrasy is that the distance between the knees is equal to the height.

The capture of the Mon capital of Thaton in Burma in the 11th cent. had deprived the Siamese Mons of leadership, so that they were being slowly absorbed; and when, late in the 13th cent., the southern thrust of Kublai Khan started the Shān-Thai people moving again, the Khmer power was only a fragment of what it had been. It was not difficult, therefore, for Meng Rai to conquer Northern Siam and establish a Thai capital at Chiengsen, nor for Rām K'amheng, himself a Thai, to conquer the rest of the country and set up his capital at Suk'ōt'ai. This is the beginning of what is called Siam or Thailand. Architecturally and sculpturally both sections of the country drew on Pāla India (via Burma), on Burma, on Ceylon, and on China. Nearly all statues are bronze and nearly all represent the Buddha seated in the earth-touching pose. The stylistic peculiarities of these Buddhas at Chiengsen are tightly crossed legs, full body with feminine chest, oval face, high-arched eyebrows, arched nose, small mouth, fleshy chin, and an *usnīsa* like a lotus bud. The bronzes of Suk'ōt'ai have *usnīsas* in the shape of a flame, as in Ceylon; otherwise, they have the same characteristics as those of Chiegsen, but all have been exaggerated: the eyebrows and the nose are more arched, the mouth is smaller, and the face is elongated. In addition, the figures appear blown up, instead of modelled and cast.

The **school of U-T'ong** in the 14th cent. continues the production of bronze Buddhas in two styles, one pure Thai and the other derived from the Bayon of Ankor Thom. The school of Ayuthia, on the foundations of the ancient Dvāravatī, accentuates the attenuation of the figures to the point of complete decadence.

At Sawank'alōk were manufactured ceramics derived from Chinese celadon, Tz'u-chou, and other Sung dynasty wares. Later, porcelain was made in China after Siamese designs and sent to Siam for decoration.

In considering **Cambodia** one must take into account the kingdom of Funan, which existed at least as early as the 3rd cent. A.D. and supported both Hīnayāna Buddhism and Brāhmanism. In the 6th and 7th cents. Funan was overcome by Chen-la, which was itself divided into two parts. Early in the 9th

cent. Jayavarman II, a Javanese, united the two Chen-la and founded what is referred to as Cambodia, a country on the Mekong River composed of Kāmbuja (born of Kambu) or Khmers. It cannot be said under which hegemony the art of this early period was produced, but it is known that the first temples were made of brick after Indian models and that the first sculptures were inspired by, though not copied from, Indian originals. Of these the earliest appear to be half-life-sized statues of Visnu inspired by the Kusāna sculpture of Sārnāth and Mathurā. Then come life-sized and larger figures, mostly of Harihara, and a group of Buddhist statues, all of which are close to Gupta and may have derived their impetus through Dvāravatī. The majority of the Hindu statues stand with the weight distributed equally between the two feet, whereas the Buddhist have the weight on one foot and the hip thrown slightly to the side.

About 900 A.D. Yaśovarman I moved the capital to Ankor and built over a small hill in the center of the city a "mountain-temple" known as Phnom Bakheng, which doubtless originally had at its top a shrine housing a *lingam*. This marks not only the beginning of the classical period, but also the complete independence of Khmer architects and sculptors from Indian influence. In the Roluos group there is a survival of brick construction, whereas both brick and sandstone were used at Koh Ker. From the middle of the 10th cent. to the middle of the 12th, Bantéay Srei, the Baphuon, and Ankor Wāt were built all of stone. Not only is Ankor Wat the most famous of the thousand odd temples of Cambodia, but also it is the culmination of the extraordinary architectural genius of the Khmers. Despite its size, the large number of different elements of which it is composed, and the incredible profusion of its decoration, every detail is subordinated to the whole, so that it stands—in partial ruin—as the perfect example of the concept of the "mountain-temple." These **mountain-temples** of the Khmers were always in the form of stepped pyramids symbolizing Mount Meru, the center of the Universe, and at the top was enshrined the *lingam* representing the divine energy of the god-king (**devarāja**).

The best Cambodian sculpture is unsurpassed and embodies, regardless of its date of production, a combination of the sensual and the spiritual, the human and the divine, that stirs both the emotional and the intellectual depths. The Ankorian approach was concerned more with relief, whereas the pre-Ankorian sculpture was mostly in the round and had no relation to the architectural background. Thus, the enormous amount of energy that is confined in a single early statue is released to comprise a whole later building, sculpture and all, with a consequent decrease in immediate impact that is balanced by an increase in synthetic breadth. The reliefs of Ankor Wāt, representing episodes from two great Vaisnavite epics, the *Mahābhārata* and the *Rāmāyana,* are marvels of complex yet perfectly clear composition.

About 1200 A.D. Jayavarman VII built the walls and gates of the city of Ankor Thom and, in its exact center, the Bayon, which is a microcosmic model of the macrocosm. Sculpturally slightly decadent, it exemplifies iconographically the acceptability to the Khmers of either Buddhism or Hinduism, for each of its many towers contains four identical faces of the Buddhist Lokeśvara and yet represents the Hindu *lingam.* Since the faces were done in the likeness of the king, the building symbolizes the power (*lingam*) of the god-king (*devarāja*) and also of the god (Lokeśvara). The bas-reliefs of the Bayon are decidedly inferior, with a marked tendency towards realism and a consequent loss of form.

The bronzes of the Ankorian period are miniatures of the stone sculpture, except that the different medium has been subjected to a suitable technique. The subjects are both Hindu and Buddhist.

In the middle of the 15th cent. the Siamese (Thai) defeated the Khmers and sacked Ankor. Cambodian art since this date is insignificant.

At the height of its power Campā occupied the territory now known as **Annam.** The people were warlike and fought consistently with the Cambodians, the Chinese, and, especially, the Annamites, who began forcing them southward in the 11th cent. and finally conquered them in the 17th cent.

The dating of Cam monuments is in a state of extreme confusion. The earliest piece of sculpture found on Cam soil is a standing bronze Buddha that must have been made at Amarāvatī (India) or Anurādhapura (Ceylon) in the 3rd or 4th cent. In spite of this fact there is no early "Indian period" in Campā, architecture and sculpture bursting into full flower with obvious Cambodian, some Javanese, some Chinese, and some Annamite influence. The earliest native monuments are found at Tra-kiēu, Mi-son, and Dong-duong in the northern province of Quang-nam, and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

probably date between the 7th and the 11th cents. All extant buildings are of brick, those at Mi-son consisting, like most Cam structures, of disconnected towers and long rooms reminiscent of segments of Cambodian edifices. Apparently they were built at different times over a period of about three centuries, but all are remarkable for their tall pilasters and opulent decoration. The only Buddhist site in Campā, the great shrine at Dong-duong, gives evidence of a more coherent plan without any lessening in the luxuriance of the decoration. By the 11th cent. the ornament had been largely given up, but its place is taken, as at Binh-dinh, by soaring pilasters that convey an extraordinary feeling of aspiration.

Regardless of where it was made, Cam sculpture presents a paradox. Much of it is devoid of character, yet the best is notable for a concentration of rugged force and sculptural synthesis that is hardly surpassed. Most statues of females are refined, sensuous, and sometimes noble; most statues of males are coarse, sensual, and brutal. All of the finest have power, in one way or another.

When the Cams began succumbing to the Annamites in the 11th cent., their sculpture grew less interesting, so that there is little of significance from Binh-dinh. It may be mentioned that all Cam sculpture is in sandstone, usually brown, but sometimes gray, and that all is Hindu. With the exception of the early Indian bronze, even the statues found in the Buddhist buildings at Dong-duong are Saivite. See *History of Indian and Indonesian Art,* A. K. Parmentier, 1922. —H.Ho.

**space arts.** Those fine or visual arts such as painting, sculpture, and architecture that are particularly concerned with space, light, and color; those arts dealing with either the representation of forms in space (as painting, drawing, etc.), or whose products are erected or constructed in space, as are the products of sculpture and architecture; to be distinguished from those fine arts not concerned esp. with space, such as music and poetry. Whitford and Winslow in *Dictionary of Education.*

**SPAIN, ART OF** (from Roman times exclusive of Mohammedan work). Unlike the other principal countries of Europe our knowledge of the role played by Spain in the various fields of art is not as yet based on definitive conclusions. Large areas still exist which demand scientific analysis although scholars both native and foreign have done much in the last twenty years toward clarification.

Lamperez y Romea wisely stated, "The art of Spain is alluvial." Numerous foreign influences have recurrently sifted on Spain to be absorbed and modified by local physical and spiritual conditions. The Spanish temper itself is best explained by acknowledging its dependence on both native Christian and absorbed Mohammedan factors. Their intensity of religious zeal, austerity, and expression mingles with certain stoic qualities, love of luxury and individualism that stems from the followers of Mohammed. This accounts for various surprising factors in their art productions such as the recurrent use of an excitingly rich motif set as a foil against a large austerely plain area (q.v. Plateresque).

In general sublety and refinement count for less in Spanish work than does boldness and vigor of conception. In architecture this is explained by the intensity of reflected light which is a product of both her atmospheric conditions and a certain harshness found in her landscape setting. This strong reflected light destroys subtle shadows on delicate form and renders them inconsequential, whereas in Greece the reverse is true and thus renders refinements in form desirable. One learns to look for drama, intensity of expression, and swift contrast in the various arts in Spain. The principal currents of her influence radiate most distinctly beginning with colonization in the Americas. The dependent cultures of the countries of South America and Mexico are now recognized as of genuine importance.

*ARCHITECTURE.* ROMAN PERIOD. Roman influence dates from the end of the 3d cent. B.C. when the Carthaginians were overthrown by Scipio Africanus and terminates with the invasion of the Northern tribes in the 5th cent. A.D. Rome established here the pattern of her own political and cultural system. Numerous fortifications were established, excellent highways engineered, aqueducts con-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

structed and the growth of cities assured which were then embellished with temples, basilicas, therme, theaters, imposing urban dwellings and adjacent villas. As elsewhere in Roman possessions, the style of these as closely as possible followed those prevailing in Rome itself. They are often distinguished by their size rather than artistic merit and failed to attain the staus of a separate style. Plan types are essentially Roman as are methods of construction.

While Roman remains are not numerous in Spain they are impressive. They include the justly famous six arched bridge at Alcántara (early second century A.D.) built of granite laid without mortar or metal clamps, which rises 180 feet above the surface of the Tagus river. The bridge at Merida (reign of Augustus) exceeds a half mile in length, while various smaller bridges remain. The great aqueduct at Segovia in some respects surpasses the Pont du Gard at Nimes as an engineering achievement. Roman fortifications of importance remain at such centers as Seville and Leon. Amphitheaters are represented by the example at Santiponce and Mérida. A well-restored theater at Merida (18 B.C.) complete with *scenae,* Corinthian columns and sculpture exists; and with the theater remains at Ronda la Vieja they yield us important information. A triumphal arch 43 feet high, two temples, a well-defined circus and numerous other remains are found at Merida and indicate the colonial importance of the city. A basilica occurs at Talavera la Vieja; a small Corinthian temple at Vich; triumphal arches at Medinaceli and Caparra; and tombs of architectural importance near Tarragona, Caspe and Sádaba.

VISIGOTHIC PERIOD (mainly 6th and 7th cent.). Christianity dates from the 2d cent. in Spain although its early phase (2d to 6th cents.), prior to the Visigothic period, is evidenced by only scant remains largely represented by the basilica of S. Peretó near Manorca (on Majorca), the palace at Mérida and the baptistry of Gabia La Grande near Granada. More is known of Visigothic work. While considerable controversy exists regarding dates of buildings and parts of buildings, it is evident that constructions of high interest were achieved that warrant continued study. Both the barrel and groin vaults were employed on three aisled basilican, cross-inscribed and cross-exposed types of plans. A good sense of mass composition is felt. Decorative instinct is sound but not of high maturity. Influence from Syria and Persia is acknowledged (q.q.v. Dieulafoy, Bevan). The slightly flattened (three-centered) horseshoe arch (q.v. Gomez Moreno) and barrel vault is used prior to the Mohammedan conquest (711) when the full circular (one-centered) horse-shoe shaped arch from Persia is introduced. The transept, low central tower, side portico, square sanctuary, rectangular *prothesis* and *diaconicon* and pierced stone window grilles are employed here. Construction is craftsman-like and enduring. Architectural sculpture is mainly linear in conception, and of only moderate merit, but some use is made of borrowed Roman details. The chief monuments include the church of S. Juan at Baños (661 A.D.); San Antolin, (late 7th cent.) under Palencia Cathedral; S. Comba de Bande at Orense (8th and 9th cent.); S. Pedro de la Nave (probably early 8th and 10th cent., q.v. Bevan) near Alcañices; S. Eulalia (6th cent.), Toledo; S. Sebastián (7th cent), Toledo; and remains of churches at Elche, near Alicante and Cabeza del Griego near Ucles.

ASTURIAN STYLE (mainly 9th cent.). This style takes its name from the small northwest corner of Spain which, with Galicia, was the only part of the country left unconquered by the Mohammedan invasion. Here in a region only forty by thirty miles in area, Christian architecture progressed from Visigothic precedent, blended with some Carolingian influence and independent solutions which by the 9th cent. permits it to be regarded as an individual style with monuments that hold their own with most contemporary western European work.

The style is marked by sturdy construction of stone with large flat brick often used for the arches (q.v. Carolingian work). Plans depend largely on the single aisle and three aisle basilica types although evidence points to the survival of the cross-inscribed-in-square plan. Several instances of the imposing two storied narthex occur with arches springing from columns with linearly enriched shafts and boldly executed capitals sometimes showing debased classic and some provincial Byzantine influences. The stilted round arch of Carolingian work is used rather than the horseshoe-shaped arch. Naves are covered with stilted round-arched barrel vaults with ribs that synchronize but do not connect, with the pier supports below. The square sanctuary is flanked by rectangular compartments which generally open to the transept instead of connecting with the sanctuary. A choir screen

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

or *iconostasis* separates the sanctuary from the rest of the church. Effects of increased height are evident over Visigothic work. Well marked flat wall buttresses are systematically used on the exteriors. Windows are fitted with handsomely-pierced stone screens. Both double and triple arched window treatments occur.

Among the important surviving examples are the imposing church of Santullano (791 to 842 A.D.) near Oviedo; S. Maria de Naranco (mid. 9th cent.) near Oviedo, probably a royal palace originally but later a church; S. Miguel de Liño (mid. 9th cent.) adjacent to S. Maria de Naranco, near Oviedo; S. Cristina de Lena (mid. 9th cent.), between Oviedo and Leon, recently reported a war casualty; S. Salvador de Valdediós (893 A.D.) near Villaviciosa, S. Salvador (921 A.D.) at Priesca, near Villaviciosa; and S. Salvador de Fuentes, (1023 A.D.) near Villaviciosa.

MOZARABIC STYLE (mainly 9th through 11th cents.). This phase takes its name from the work of Spanish Christians who had through either necessity or choice adopted various of the customs and even the language of the Mohammedans. In their Christian architecture they blended to some extent the procedure of the conqueror with that of Visigohic and Asturian practice. Their work varies from products of definite beauty to works of moderate merit. Four separate schools of work are recognized: the Leonese basilicas, the Western hermitages, the Arogonese hermite caves, and the Catalonian churches (q.v. Bevan). In general it may be noted that single and three aisle basilica type plans occur with adaptations that betray connecion to Mosque plans (e.g. Cordova). Ribbed barrel vaults, an unusual system of barrel vaulted cupolas or even the timber truss roof may mover the nave. Apses may be horse-shoe shaped in plan on the interior or square with a barrel vault. The eastern type of single centered horse-shoe shaped arch is found recurrently supported on either columns or piers. Sculpture varies from notably fine work in S. Maria de Lebaña to work of little merit. Among the principal examples of this style are: S. Miguel de Escalado (913 A.D.) near Leon; S. Maria de Bamba (prior to 928 A.D.) near Baños and Mazote; S. Maria de Lebeña (931-937 A.D.), east of Ofiedo; Santiago de Peñalba, (prior to 919 A.D.) in the Vierzo Hills; S. Miguel de Celanova (c. 940 A.D.) south of Orense; S. Maria de Marquet (last half of 10th cent.) near Tarrasa; S. Millán de la Cogollo (c 929 A.D.) east of Burgos; and S. Baudel (probably 11th cent.) southeast of Burgos near Berlanga de Duero.

ROMANESQUE (mainly 11th and 12th cent.). The Romanesque architecture of Spain is, broadly speaking, divided into two main schools, the Catalonia and the Castilian (q.v. Bevan for separate stylistic qualities). It is now recognized that Spain played an important role in the Romanesque period. Despite her internal conflict with the Mohammedans, she achieved a kind of national unification in the North which allowed important constructions in the early decades of the 11th cent. Foreign influence first comes from Lombardy and is expressed in such examples as the great Abbey Church of Ripoll (1020-32 but largely rebuilt in 1887, after serious damage in the Carlist wars, according to original scheme) and San Vincente de Cardona (1020-1040). This is followed in the latter half of the 11th cent. by French influence (the extent and even the direction of influence is debated by Spanish and Frnch scholars) as seen in such examples as Santiago de Compostella (probably begun in 1075 and largely finished in 1128 but much altered in the 18th cent. by a baroque west facade); S. Martin de Fromista (1066); S. Isidoro at Leon (1054-1067); the Old Cathedral, Salamanca (1120-78); the Collegiate Church at Toro (12th cent); Cathedral of Zamora (1174); S. Pedro (early 12th cent.) at Avila and among the many important conventual examples are the Cistercian Abbey of Poblet (mainly late 12th and early 13th cent) and the Monastery of Veruela (last half of the 12th and early 13th cent.).

While generalizations are difficult regarding the characteristics of Spanish Romanesque architecture the following may be noted: Plans are three aisled basilicas terminating in three apses with the center one deeper, with or without transepts. An occasional use is made of the central type plan, e.g. Santa Vero Cruz (1208) Segovia. The barrel vault is employed first with round arches and then pointed arches, finally rib and panel vaulting on square bays is introduced. The triforium gallery or a clerestory is commonly met with but a combination using both is rare. Some examples use neither, having the vault spring from a line shortly above the crown of the nave arcade. Due to the practice of pulling the enclosed choir past the crossing and down into the nave (protected by stone or metal screen), naves tend to be wide and the central

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

apse not remarkably deep except in the famous example of Santiago de Compostella which had the first apse in Spain with surrounding vaulted ambulatory aisle and radiating vaulted chapels. Roofs are rather flat in slope and protected with tile. Windows and door openings tend to be small with deep reveals. Walls are plain except for strategically placed concentrated enrichment about the doors, windows, and in the imposing lantern over the crossing. This last feature is one of the pleasant accomplishments of the period in Spain. Boldly conceived they attain fine plastic and decorative quality while effectively serving to light the choir below (e.g. Old Cathedral Salamanca and Collegiate Church, Toro). (See Hershey.)

In spite of foreign influence the style attains a national character, well suited to native climate and temper. The flat slope of the roofs testifies to a dry climate, the small openings and numerous one and two storied cloisters indicate the harsh sunlight. The vigorous sculptural forms without plastic subtleties recognize the visually destructive quality of the strong reflected light so characteristic of much of Spain, that would tend to obscure, or visually destroy, small scale refinements.

GOTHIC PERIOD (13th to mid-16th cent.). The Gothic development in Spain produced work of real distinction though unequal in quality. The unification of northern Spain under the Christians allowed commercial prosperity to develop. Catalonia, then as today, was the most progressive and built up rich trade connections which allowed her to undertake important constructions. Her initiative and justifiable pride asserted itself in her new architecture. While Aragon was indifferent and Castile subservient to French Gothic ideas, Catalonia surveyed the building procedures of the Ile de France, Languedoc and that of the Cistercian Order. She then embarked on a sensible course of adjustments that incorporated foreign ideas and yet satisfied her own special needs. The resulting general characteristics are: large, lofty, single-aisled church plans, or plans with wide nave and narrow high side aisles. Large churches terminate at the east end in a broad chevet, and small ones in triple apses. Interior buttressing is usual with aisle chapels between them. On the exterior, the buttress may or may not be expressed on the lower part of he church but projec boldly above the aisle roof and connect with the line of outward thrust of the nave vaults. In the 13th and 14th cents. four part rib- and panel-vaults are used functionally. The triforium gallery is often dispensed with or greatly curtailed in importance. The clerestory is kept small as the problem was often to limit side light and concentrate on a large richly glazed area at the altar end. Otherwise, windows are small but sharply vertical inproportion. Effects of great breadth and height were striven for and one of the prevailing characteristics of Spanish Gothic is the carefully calculated effect of spaciousness and lift. Facades often make use of triple-arched portals, great flankinv towers, imposing lanterns, and important transept porches. In common with Gothic elsewhere in Europe, the style grows richer and less vigorous in the 15th cent. with more dependence placed on decorative instead of functional expression. In line with this, window tracery changes from geometric to curvilinear designs and vaulting loses its sleek structural quadripartite system and becomes multiribbed, stellar, etc.

The cloister, as in the Romanesque period, plays an imposing role. Indeed the shaded court, patio and loggia is a recurrent theme in ecclesiastical, civil, and domestic planning to the present time due not only to climate, but also to an almost oriental love of privacy hat motivated Christian Spain which may well stem from contact with the cultivated Moors.

Important examples are: Barcelona Cathedral (mainly 1298-1339), a key church in Catalonian work; S. Maria de Mar (1328-1383), Barcelona; Collegiate Church (1328-1596), Manressa; Palma Cathedral on Mallorca (mainly 1229-1380), one of the most spectacular of all Gothic achievements with nave height exceeded only by Beauvais Cathedral in France. Gerona Cathedral (begun in 11th cent. but mainly 1316-1458 with vaults not complete until 1598), outstanding example of the great single-aisle plan with interior span of 73 ft. (widest in Europe); Burgos Cathedral (1221-1230, spires 1442-1558, choir 1497-1512, lantern finished 1568); Toledo Cathedral (1227-1493); Seville Cathedral (1402-1520) one of largest Gothic cathedrals in Europe but exterior design much obscured by Renaissance additions; New Cathedral of Salamanca (1513-1560); Segovia Cathedral (1522-1593); Monastery of Las Huelgas (1249 near Burgos; Alcazar (1352-1358), Segovia, now restored; Castle of Olite (1403-1419); The Audiencia Palace (1436) Bercelona; Casa Consistorial (1369-1378) Barce-

lona; and *La Lonja* or Exchange (1482-1498), Valencia.

PLATERESQUE STYLE (late 15th to last quarter of 16th cent.). The characteristics of this syle are based on decorative aspects rather than new structural principles of its own. Rightly, it should be regarded as marking the end of the Gothic period and the ushering in the Renaissance and so should be treated in two separate phases (Q. V. Bevan). Characterized by compactly massed decoration unified into large zones of ornament, it finds its basis in the decorative procedure of Mudájar work stimulated at a time when new wealth on an appreciable scale was making possible a sumptuous effect that appealed to the Spaniard at this time. Because of the richly wrought character of the decoration and its obvious relationship to the spirit of ornament prevalent in the work of native silversmiths, *plateros,* subsequent generations of critics (17th cent.) called it the "Plateresque style". According to the particular critic, the style is either regarded as marked by rich decorative insight, coupled with highly individual quality and truly expressive of the Spanish taste and temper; or held to be aesthetically inconsequenial and lacking in any true functional quality. It cannot be denied that decoration, in the main, exists wih a definite disregard of fundamental relationship to the structural core of the building, although its manipulation is often marked by a freshness and decorative insight that yields effects of undeniable charm.

No clear boundaries separate the Gothic from the Renaissance phase of the Plateresque style. In certain instances the same architect produced work in each phase. Their difference is primarily based on whether the work is applied to buildings based on Gothic or Renaissance plans and structural procedures and whether the individual elements making up the compacted areas of rich decoration are curvilinear Gothic arches, Gothic sculpture, pinnacles, tracery, etc. (Gothic phase); or freely interpreted classic elements such as pilasters, columns, entablatures, pediments, candelabra, etc. (Renaissance phase). The recurrent use of heraldic devices was common to both and indeed the devices characteristic of the separate phases are sometimes found in combination.

Some of the leading master masons, or architects, were foreigners (from France, Germany, and Flanders) whom we know primarily through the Spanish equivalent of their names such as the de Egas, Güas and de Siloee families. Other architects of importance include Alonso de Covarrubias, Francisco de Colonia, and Rodrigo Gil de Hontañón.

HIGH RENAISSANCE (last three quarters of 16th cent.). This period is relatively dry and uninspired. Definite knowledge of the principles of the High Renaissance in Italy are evidently a part of the equipment of the leading architects of the times but is applied with unequal adherence to Vitruvian theory. As heretofore variety in regional effort is discernable. In the large region around Granada, Renaissance motifs are sometimes applied to Gothic plans and may still retain medieval rib vaulting (Cathedral of Granada) but may also, as in the unfinished Palace of Charles V, reveal a close dependence on Italian Renaissance procedure. In general Andalusia in the southwest, Central Spain around Toledo, and Madrid and Northeast Spain acknowledge Italian Renaissance precedent. Upper Castille and Galicia are conservative in undertaking the new manner but continue it overly long. The Escorial, monastery-palace of Philipp II represents a streamlining of High Renaissance design principles as practiced in Italy by Michelangelo and made popular by the Spanish translation of Serlio. Coldly austere, built of gray granite, on a gigantic plan including seventeen courtyards, it is expressive of the calculated restraint of the style dogmatically established by Juan de Herrera. The architects of the time include Alonso de Covarrubias and Simon de Colonia who likewise practiced in the Plateresque manner. Juan de Herrera, Juan de Toledo, Diego de Siloee, and Pedro Machuca attain genuine importance. Of lesser note are Pedro and Andres Valdelvira, Bartolome Bustamante and Francisco de Villapaudo. Noble scale is sought in the great buildings of the times. Great attention is paid to courtyards and imposing stairways. Private palaces often make use of corner towers, and loggias in the upper stories. Convenience in planning is often sacrificed for imposing effects. Representative buildings are: Cathedral of Granada (1529- facade, 17th cent.) by Diego de Siloee; Cathedral of Valladolid (1585) by Juan de Herrera: Palace-Monastery of the Escorial (1563-1581) by Juan Bautista de Toledo and Juan de Herrera; Palace of Charles V. Granada (1527) mainly be Pedro Machuca, Tavera Hospital, Toledo (1541) by Bartolomé Bustamante; Reconstruction of the Alcazar, Toledo (mid-16th

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cent.) by Alonso de covarrubias, Francisco de Villalpando Enrique de Egas et al.

BAROQUE STYLE (late 17th to middle 18th cent.). The Baroque movement in Spanish architecture marks the expression of the individualistic sumptuous aspect of the native taste that had been curtailed since the plateresque style. While related to Italian baroque design, no servile following is evident. The Spanish people found evident delight in the new style and her architects moved with freedom and independence within its fertile field. Zestful invention grows into excess in the building up of fabulously enriched designs that finally reach their maximum in the work of followers of José Churriguera. Plans are complex, often involving the use of curved elements. Domes and towers are frequent but the chief characteristic is a striving for rich plastic effects in both two and three dimensions. While decoration is somewhat concentrated in early work, it expands everywhere in Churrigueresque designs (q.v. sacristy of La Cartuja, Granada). The classic elements are freely distorted, used at different scales in the same design in ways diametrically opposed to their functional nature, and are often united with plant forms constructed in stone, marble, or stucco. Serpentine columns, broken pediments, scrools, volutes, human and animal forms in sculpture are all found strangely and richly welded together. At its best, Spanish baroque architecture compares favorably with any produced in Europe, at its worst it lacks all pretension to distinction. Toward the end of the period the Bourbon rulers introduced French designs that reflect the styles of Louis XIV and Louis XV in their residences such as the Royal Palaces of Madrid, Aranjuez and La Granja but this manner never became popular. Chief among Spanish architects of the period were José Churriguera (and his extensive family), Narcisco Tomé and Fernando Casas y Novoa. As usual some foreign architects were employed as Carlo Fontant, Filippo Juvarr, Giovanni Battista Sachetti and Theodore Ardemans. Examples of buildings include the Jesuit College at Loyola (1686) by Fontana; West Facade of Santiago de Compostella (1738) by Fernando Casas y Novoa; University, Valladolid (1715) by Narcisco Tomé; Town Hall, Salamanca (1720-1733) mainly by José Churriguera; Academy of San Fernando, Madrid (early 18th cent.—former Goyeneche Palace); Royal Palace at Aranjuez (1715-78) mainly by Pedro Caro; Royal Palace, la Granja (1721-35) begun by Theodore Ardemans and continued by Juvarra and Sachetti; and Royal Palace, Madrid (1734-1764) by Juvarra and Sachetti.

NEO CLASSIC PHASE (last half 18th early 19th cent.). The work of this period is dominated by the academicians who sponsored a return to restrained classic design. Attempt is made to infuse a true Vitruvian spirit in the use of the Orders and some effort of a Greek revival nature is also effected. The dominant architect of the period is Venture Rodriquez who designed innumerable structures which include: The Church of San Marcos, Madrid (1749-1753); Augustinian Convent, Valladolid (1760) and the facade of Pamplona Cathedral (1783). Sanchez Bort executed the facade of Lugo Cathedral (1784); Francisco Sabatini did the Hacienda Ministery, Madrid (1769) and Juan de Villanueva introduced Greek influence in the Prado, Madrid, (1785).

The subsequent years of the 19th cent. are given over to using earlier styles to solve the current building problems. Romanesque, Gothic and Renaissance revival types are all found. The 20th cent. concerned itself with ecclectic designs stemming from the *Institute des Beaux Arts,* in Paris to be refuted by the proponents of the International Style (q.v.) who prior to the Spanish Revolution succeeded in introducing work of a crisp functional type of considerable merit.

*PAINTING.* Spanish painting offers a rich field for future investigation. Except for a relatively few outstanding masters of great impotrance much is yet to be done in the accumulation and correlation of knowledge of both the lesser known personalities and the separate schools of painting. The work of Chandler Rathfon Post, in this connection, is of the highest importance.

PRE-ROMANESQUE (up to 10th cent.). Few examples survive on which to base judgment. It appears that the principal characteristics stem from interpretations based on provincial Roman painting. The technique is dependent on that of Roman Mural decoration but accomplished with little evidence of finesse. The quality of line is uninspired and esthetic conception impoverished. Remaining examples include the wall paintings from S. Miguel de Linio, S. Eulalia de la Bóveda and S. Julian de los Prados.

ROMANESQUE (10th to 13th cent.). Spain is rich in surviving examples of this period compared with other European countries. Painting is, however, almost entirely confined to the enrichment of church decoration and is found throughout much of the area covered

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

by Christian Spain at this time. The technique is a simple one, unrelated to the true fresco process. A whitewash ground was laid and the designs applied directly on this in water-soluble pigments. Retouching was effected with the same pigments mixed with thin binders and lastly a thicker tempera was used to clarify details. The brilliant colors used have stood well the test of time.

While the work of regional schools is not clearly marked, two prevailing types of procedure are evident. The first is the most strongly native in feeling and stems from the illuminations in early Spanish manuscripts. This is marked by a grave architectonic quality, a somewhat abstract stylization and simple but vigorous color organization. Figures loom large in the compositions and are set against simply enriched backgrounds. The second bears obvious dependency on Byzantine Mosaic composition and doubtless was intended to substitute for the mosaic technique as practiced in Italian examples. In general the draughtsmanship is less rigidly stylized and acknowledges a more realistic representation. Examples of note include: Apse mural from S. María de Mur (c.1150) now in the Museum of Fine Arts, Boston; Apse mural from S. Clemente de Tahull (c. 1123) now in the Barcelona Museum; murals in the Panthéon de los Reyes in S. Isidro of Leon (last half 12th cent.); Apse decoration from Pedret (probably late 12th cent.) now in the Barcelona Museum. Panel painting as applied to alter decoration may be represented by the altar frontal from Martinet (c.1175), Worcester Art Museum and a later example, The Pantocrator with incidents in the S. Martin Cycle (c.1250), Walters Art Gallery, Baltimore.

GOTHIC (13th through 15th cent.). The achievements in painting in Spain at this time are of genuine significance. While connection with France, Italy, and Flanders are all evident, the strong impress of native taste and temper is undeniably present. The separation from Romanesque work is slowly accomplished in the 13th cent. More ease of composition, a greater degree of naturalism and a more telling quality of draughtsmanship eventually identify the new procedure as noted in surviving murals and altar panels. In the 14th cent. Italian Gothic influence competes with the French Gothic and Flemish influneces, each having practitioners largely throughout Christian Spain.

Examples of the Franco-Gothic styles are murals in S. Pablo de Casseras, Cardona; retable of S. Andrew, Cloister Museum, N. Y.; and altar frontal with Holy Trinity and Passion Scenes, Kelikian Collection, New York; and the imposing retable of Pedro Lopez de Ayala, Art Institute, Chicago.

The Italo-Gothic style of the 14th cent. emanates largely from Siena via the papal court at Avignon. A spirit of gentle piety and mysticism, a use of rich color areas, flower-spangled fabrics, fine calligraphic flow of drapery and incised gold backgrounds characterize the work. It is likewise accompanied by a more skilled technical manipulation. Panels are well prepared with gesso for the tempera painting. Green underpainting is used for flesh areas and then thinly glazed as in Sienese work. A pioneer in this style was Ferrer Bassa (active 1324-1347) who successfully combines Sienese idealization with a Spanish tension as exemplified in his painting of the Nativity and the Pietá (c.1346) on the walls of the S. Miguel chapel in the convent of Pedralbes, Barcelona. Arnau de la Pena (active 1355-1385) is responsible for both the illumination of manuscripts and important panel paintings as The Polyptic with scenes from the Life of Christ and The Virgin (c.1375), Morgan Library, New York and the retable of S. James in the Barcelona Museum. The two Serra brothers, Jaime (active 1361-1395) and Pedro (active 1363-1400) are important both for their projection of the Italo-Gothic style in their own work and for the wide influence they exerted through their many followers. Pedro Serras retable of the Pentecost (c.1394) in Manressa Cathedral while showing a lack of facility in figure organization, incorporates landscape elements against the gold ground and infuses a psychological awereness in the faces of his personages. Jaime Serra did the Holy Sepulchre Retable, Saragossa and among other productions the panel of the Adoration of the Shepherds (c.1360) in Montillor collection, New York. In the 15th cent., Spanish artists are mainly divided between adherents to the International Style and those influenced by contemporary Flemish work.

The proponents of the International Style (15th cent.) are identified by the high decorative quality of their work based on a rich, ornamental, calligraphic quality of their work based on a rich, ornamental, calligraphic qualbased on a rich, ornamental, calligraphic quality and aristocratic stylization. Expression of third dimension is expressed in a more decorative, less vigorous way than by His-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pano-Flemish artists. Color tends toward clear tonal effects with an absence of strong patterns of light and shade. Artists working in the International Style include: Luis Borrassá (1380-1424) who, working in Catolonia, achieves a heightened pictorial quality and an added sense of vigor and realism. He is mainly influenced by Sienese work of such masters as the Lorenzetti and Orcagna. He does away with the gold background and sets his figures in more realistic surroundings. An outstanding example of his work is the Retable of the Guardiola (c.1410-1420) in the Soler y March collection, Barcelona. Bernardo Mantorell or the Master of St. George (active 1427-1452) combines Italian and Franco Flemish influence and lays the foundation for the local characteristics of the Catalan School. The Art Institute of Chicago owns his important Retable of St. George (c.1430); Scenes from the Life of S. Lucy is in private hands in Barcelona; and the Vich Museum owns the Retable of the Magdalen. Jaime Jacomart (c.1410-1461) of the Valencian School worked in Naples and probably in Rome. His Italianized manner exerted appreciable influence in his native school. His retable of S. Martin (c.1447-1457) is in the Diocesian Museaum of Segorbe. Jaime Huguet (active 1448-1489) brings to a focus the medieval Catalan manner and foretells Renaissance procedure. His style represents an extension of the work of Mantorell with some admixture of Flemish influence. Through commisisons from Sardinia, his work established the character of native Sardinian painting. His employment of many assistants in his numerous large retable accounts for the uneven quality of his work. Contrary to general Spanish practice, he is reported to have worked from living models which accounts for his fine breadth and simplicity in handling both the human figure and drapery. In his best works he achieves a heightened quality of individual expression and feeling. His important Retable of the Portuguese Constable (c.1465) and his S. George and the Princess are in the Barcelona Museum.

The Hispano-Flemish style in Gothic painting (14th and 15th cent.) expressed itself in most of Christian Spain. It results from contact with the work of the great Flemish artists. Is practitioners varied from a relaively close dependence on Flemish precedent, to mere assimilation of certain technical procedures to effect (at the end of the century) works thoroughly Spanish in temper. The general results of this influence resulted in use of the oil medium and a heightened sense of realism, although the Flemish appreciation for minutia of detail is seldom met with Luis Dalmau (c. 1400-1463) and Fernando Gallego (c.1440-1495) are representative of this style. Dalmau was a Castilian painter, who had worked in Flanders and came in contact with the pinting of the van Eycks, though he failed to assimiliate their old technique and continued to work in tempera. His style was personal rather than popular involving fine portraiture, elaborate architectural effects and distant landscapes. The outstanding example of his work is the Madonna of the Councilors (1445) in the Barcelona Museum. Fernando Gallego worked in Castile after study in Flanders where he came in intimate contact with the work of Dirk Bonts and the engravings of he German, Schongauer. His work is marked by an emotional, mundane quality. He was given to expressing individual detail to the sacrifice of broad compositional considerations. He executed the Pietá in Weibel collection, Madrid and the Retablo at S. Lorenzo, Toro.

RENAISSANCE PAINTING (end of 15th and 16th cent.). Two sources of influence in the main contribute to Spanish Renaissance painting. The predominant one is Italian of the Early and High Renaissance, while Flemish influence is secondary in importance. The new procedure is introduced by a group of Spaniards who traveled or worked in Otaly at the end of the 15th and early 16th cents. Their early work should rightly be regarded as Gothic and their later productions as Renaissance. At the beginning of the century greater merit is evident than at the end (with the exception of El Greco) when various second rate foreign painters (mainly Italian) came into positions of influence in Spain.

The Spanish founders of the Renaissance style include such masters as Bartolomé Bermejo (c.1440-1495), Pedro Berruguette (d.1504) and Rodrigo de Osona *The Elder* (active at least between 1464 and 1484). Bermejo worked in Catalonia and reveals connection with Flemish precednt. He employs the oil medium, avoids the use of gesso relief, attains a new power of expression and compositional skill that is comparable to Florentine work. He is represented by: the monumental painting of S. Domingo de Silos (c.1474), Prado Museum, Madrid; S. Engracia (c.1475), Gardner Museum, Boston;

S. Michael, formerly Ludlow collection, London and the great Pieta (finished 1490) in Barcelona Cathedral. Pedro Berruguette worked in Castile, influenced by his lengthy residence in Italy where he came in close contact. with Melozzo da Forli. In his best work he attains genuine distinction with the expression of inner feeling and well ordered space as in his S. Peter Martyr in Prayer, Prado Museum, Madrid and the Retable of the Life of Christ (c.1508), Avila Cathedral. Rodrigo de Osuna the Elder worked in Valencia after study in both Flanders and Italy. His figures often show the influence of Hugo van der Goes but his landscape elements stem from the school of Ferrara. His work is solidly conceived and is marked by gravity of expression and atmospheric perception, as in his imposing Retable of the Crucifixion (c.1476), in the Church of S. Nicholas, Valencia.

After the first quarter of the 16th cent. there is a heightening of Renaissance characteristics, through the influence of Pierre de Campaneer (Pedro Campagna). Grandeur and grace of composition are achieved, forms are more plastically and accurately realized, the human figure in action is studied and psychological aspects in a fuller sense are rendered. Portraiture is developed through the sojurn in Spain of the able Dutch painter Antonis or, and the work of his follower, Alonzo Sanchez Coello. Classical mythologies fail to interest Spanish patrons and, except for the newly popular portraits, religious painting is the chief outlet of the artists. In the later part of the century the building of the Escorial Palace-Monastery caused Phillip II to invite important foreign artists to come to Spain to enrich its decorations. However, only second rate painters came such as Frederico Zucchero, Pelegrino Tibaldi, Bartolomeo Carducho and Patricio Caxés. The work of these men proved an unwholesome influence on native painters, that was however somewhat mitigated by their access to the magnificent royal collecion with its great series of Titians and other works of genuine importance. The end of the century is glorified by the work of a foreigner, Domenikos Theotocópulos, called El Greco, who achieved the fullest expression of Spanish temperament combined with inventive genius of highest order.

A brief catalogue of important Spanish painters of the century and representative examples of their work follow: Alonzo Sanchez Coello (1515-1590) although born in Valencia, spent his professional life largely at the Spanish court in Aragon. He was largely subject to the Flemish influence of Antonis Mor. His work is somewhat conservative and linear in approach. Primarily a portrait painter of the court circle, he is proficient in painting richly dressed personages of considerable dignity and reserve. The characterizations are seldom penetrating, but from a technical standpoint the painting is highly finished and has good color sense. Examples: *The Infanta Isabella Claudia Eugenia,* Prado Museum, Madrid; *Juana of Austria and Her Niece Margaret,* Gardner Museum, Boston; *Prince Carlos,* Prado Museum, Madrid. Pedro Campagna or Pierre de Kempeneer (1503-1580), was born in Brussels and was early influenced by the work of Roger de la Pasture and Van Orley. He traveled to Italy, came under the influence of Michelangelo and Raphael and remained there for at least ten years. For twenty-three years he occupied a position of influence in Seville. The energy and grace combined with his sense of good composition and strong color sense were highly regarded in Spain and we think of him primarily as a Spanish artist. Examples: *Descent from the Cross,* Cathedral, Seville; *Purification of the Virgin,* c.1553, Cathedral, Seville. Luis de Vargas (1502-1568), an Andalusian painter who spent twenty-eight years in Italy and was influenced by Raphael or Raphael's pupil, Perino del Vaga. His work is correct, distinguished by fine, warm color, but is lacking in personal expression and depth of emotion. His knowledge of anatomy was a revelation to the Church restricted Spaniards. Example: *The Ancestors of Christ,* Cathedral, Seville. Francisco de Herrara the Elder (1576-1656), an Andalusian painter working mainly at Seville, is noted (together with Roelas and Morales) for infusing a native Spanish quality into 16th cent. painting. His style is morbid and his sense of composition crowded. His figures are anatomically observed, dignified and somewhat monumentally conceived. He painted many martyrdom and apocalyptic visions. He appears to have been the first artist to work with a heavy impasto. A feeling of unhealthy excitement is frequently present in his work. Velasquez worked for a time with him but was repelled both by his style and disagreeable temperament. Examples: *S. Bonaventura Received as a Franciscan,* Earl of Clarendon Collection, Oxford; *Vision of S. Basil,* 1639, Provincial Museum, Seville; and *S. Joseph with Infant*

*Christ,* 1648, José Lazaro Collection, Madrid, Puan de Roëlas (1559-1625), an Andalusian artist, like Herrera and Morales, is important for the native Spanish quality of his work. He received a classical education and became a religious painter. He subsequently journeyed to Italy and worked under Tintoretto. His work is marked by warm color harmony and fine distribution of light and shade. Like Herrera, his compositions are large and complicated. Examples: *Martyrdom of S. Andres,* Cathedral, Seville; *Apotheosis of S. Hermenegied,* Chapel of the Hospital de la Sangre, Seville. Juan de Juanes or Vincente Juan Macip (1500 or 1523-1579), a Valencian artist who studied in Italy and was influenced by the early work of Raphael. He is regarded as the founder of the 16th cent. manner of the Valencian School, but his work is of only moderate importance due to his too slavish deference to Italian work and his lack of achieving a personal style. Examples: *Visitation of S. Ann to the Virgin,* Prado Museum, Madrid; *The Last Supper,* Prado Museum, Madrid. Francisco de Ribalta (1551-1628), a Valencian artist who studied in Italy but brought back Italian principles, rather than mannerisms, which he translated into Spanish expression. He was interested in effects of chiaroscuro, as first observed in Correggio and Schidone, but projected them further toward the manner of Caravaggio and his (Ribalta's) greatest pupil, Ribera. Strong dramatic feeling, force of composition, sense of plastic relief, effects of light and shadow, and reflected light characterize his work. Examples: *Vision of S. Francis,* Museum, Valencia; *The Evangelists S.S. John and Matthew,* Prado Museum, Madrid. Fernadez Navarrette, called "El Mundo", the deaf mute, (1526-1579) studied in Italy. He was the most adequate Spanish interpreter of Titian, whom he understood deeply as to color sense, plasticity and composition. Both in draughtsmanship and coloristic attainments he stood ahead of his immediate Spanish contemporaries. Examples: *Baptism of Christ,* Prado useum, Madrid; *The Nativity,* Palace-Monastery of the Escorial. Luis de Morales (1509-1586), an Andalusian artist called "El Divino" (because he painted only religious subjects), is noted for the native quality in his painting (q.v. Herrera and Róelas). There is an indirect, dilute influence from Michelangelo in his work. His style is somewhat angular with a kind of cloying sweetness present His touch is precise and rather weakly elegant; his color is refined and delicate. He infuses an almost psychopathic quality in his faces. His early compositions are large and elaborate but his later ones are limited to one or two personages. Examples: *Madonna and Child,* Prado Museum, Madrid; *Presentation of Child Jesus in the Temple,* Prado Museum, Madrid.

El Greco, Domenikos Theotocopulos (born in Crete in 1541, died in Toledo 1614), while a foreigner, achieved the fullest artistic expression of the underlying forces that motivated 16th cent. Spanish life and thought. The buring intensity of religious fanaticism, as expressed in the horrors of the Inquisition, find artistic expression in the flame-like contours of El Greco's canvases.

Trained in Venice in the studio of Titian, we feel him more drawn to Tintoretto. Shortly after his arrival in Spain (c.1575) he undergoes a psychological change that results in a vividly personal style of painting that causes him to be classed as one of the world's greatest innovators, the "Old Master" of our contemporary "New Masters." He evolves new worlds of form, new rules of anatomy, a more and more grandly simplified sense of composition, amazing plasticity, and intense expression of vibrant, tortured, spiritual insight.

Living in his beloved Toledo, he turns his back on the court influences and refuses to compromise his personal convictions in Art. He draws about him an enthusiastic local circle of patrons, who pay richly for his canvases. Deep scholar in philosophy, literature and the Arts, he was warmly appreciative of beauty, proud and independent.

His work may be divided into three main periods of development: *First period, (c.1570-1580).* Appreciable Venetian influence, little creative distortion, sound plasticity, naturalism, and vivid light and shade mark the work of this period. Examples: *Christ Expelling the Money Changers from the Temple,* Cook Collection, Richmond; *Portrait of Guilio Clovio* (miniature painter), National Gallery, Naples; *Assumption of the Virgin,* Chicago Art Institute; *Annunciation,* Prada Museum, Madrid. *Second Period, (c.1580-1604).* He invents, or carries further, his newly felt concepts of anatomy, special composition and broader, simplified color and muted tones. He achieves a new expression of linear rhythms and fluctuation of mobile forms. He aims to express spiritual ideals, rather than naturalism. The real point of departure for this and his later work is his own Byzantine

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

background of the mosaics, frescoes, icons and manuscript illuminations of the Christian East. Without recognition of this factor, his style cannot be rationalized. Examples: *The Dream of Philip II,* Palace-Monastery, Escorial; *Martyrdom of S. Maurice and the Theban Legion,* Church of Palace-Monastery, Escorial; *Burial of Count Orgaz,* S. Tomé, Toledo; *Crucifixion with Virgin and S. John,* Prado Museum, Madrid; *Holy Family,* Hospital of S. Juan Bautista, Toledo; *Mary Magdalene,* Don Cristobal Ferriz Collection, Madrid; *Portrait of Doña Jeronima de Cuevas,* Penn Museum, Philadelphia; *S. Jerome as Cardinal,* Frick Collection, New York; *Expulsion from the Temple,* Frick Collection, New York; *Resurrection of Christ,* Prado Museum, Madrid; *Portrait of the Grand Inquisitor,* Don Fernando Nina de Guevare, Metropolitan Museum, New York. *Third Period, (1604-1614).* Simplification of form, color and composition is pushed to its maximum. The creative distortion is further pronounced in numerous paintings (*Sacred and Profane Love,* the *Assumption* (late version) and the *Laocoön*), but at the same time other pictures are sharply observed from a naturalistic angle (*Fray Felix Hortension Palavincina* portrait) proving that El Greco was not subject to astigmatism as had been suggested. Certain works of amazing power, linear and plastic unity grace this period (*Christ on Mount of Olives,* Csete Collection, Budapest), others are difficult for conservative critics to comprehend. Examples: *View of Toledo,* Metropolitan Mus., New York; *Self Portrait,* Metropolitan Mus., New York; *Fray Felix Hortensio Palavincina,* Museum of Fine Arts, Boston; *Christ on Mount of Olives,* Csete Collection, Budapest; *Laocoön,* formerly in the collection of Prince Paul of Jugoslavia, Belgrade; *Assumption of the Virgin,* San Vincente Mus., Toledo; *Salutation,* Dumbarton Oaks collection, Washington; *Sacred and Profane Love,* Ignacio Zuloaga collection, Zumaya, Spain.

SEVENTEENTH CENTURY. Regional distinctions, in the main cease to be of significance and painting may now be spoken of as national. This century is rich in achievement and in the eyes of many critics, painting reaches its culmination in the art of Velasquez. Portraits take on highest distinction; figure compositions achieve mastery by any European standard; handling of chiaroscuro, color organization, and movement attain the utmost significance, and both still-life and landscape are brought to a lofty point.

While numerous painters of varying degrees of excellence occur, the attainments of the century may be summarized in the work of the five following masters: Jusepe de Ribera (1590-1652), called because of his small stature "Lo Spagnoletto" by the Italians during his long residence there. He was a pupil of Ribalta and regarded as belonging to the School of Valencia although most of his professional life was spent outside Spain. His style is based on the teachings of his master and assimilations from the study of Titian, Veronese, Correggio and Caravaggio, which he fused into his own manner of working. If we grant that Caravaggio was primarily interested in shadow, we would have to accept that Ribera was interested in both light and shadow. His drawing is sound and his form sense monumental. By 1630 his style loses some of its harshness and takes on a more thoughtful and dignified quality, with an ever-increasing evidence of his study of light. Compositions bathed in a silvery light date around 1635, while those with a rich amber tonality begin around 1640. Examples: *Assumption of Mary Magdalene,* 1626, Academy of S. Fernando, Madrid; *Martyrdom of S. Bartholomew,* c. 1626, Prado Museum, Madrid; *S. Andres, Apostle,* Prado Museum, Madrid; *S. Paul, Hermit,* Louvre, Paris; *S. Sebastian,* Prado Museum, Madrid; *Adoration of the Shepherds,* 1650, Louvre, Paris; *The Club-foot,* 1652, Louvre, Paris. Francisco de Zurbaran (1598-1663), an Andalusian painter, was the pupil of Roélas and Herrera, but was later more permanently influenced by the heavy chiaroscuro of Caravaggio's manner which he acquired through Ribera. His work has a strongly pronounced Spanish flavor. Examples: *Bonaventura Refers Thomas Aquinas to the Crucifix,* 1629, Kaiser Friederich Mus., Berlin; *Apotheosis of S. Thomas Aquinas,* 1631, Provincial Museum, Seville; *S. Hugo Enters the Refectory,* 1636, Provincial Museum, Seville; *A Student of Salamanca,* Gardner Museum, Boston; *Dominican Monk,* Hispanic Society of America, New York; *S. Casilda,* Prado Museum, Madrid.

Diego Velasquez de Silva (1599-1660), born in Seville of Portuguese parents, spent the major part of his life at the Spanish court. With El Greco, he dominates Spanish art and ranks as one of the world's greatest painters. His brief study with Herrera and the subsequent work with the scholarly but relatively unimportant Sevillian painter, Pacheco, seem but minor preparation for his

Diego Velasquez de Silva (1599-1660), born in Seville of Portuguese parents, spent the major part of his life at the Spanish court. With El Greco, he dominates Spanish art and ranks as one of the world's greatest painters. His brief study with Herrera and the subsequent work with the scholarly but relatively unimportant Sevillian painter, Pacheco, seem but minor preparation for his

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

eventual achievement. Velasquez goes down in history as a great observer of natural appearance. Effects of enveloping atmosphere are magically caught in his later works. Always courtly and dignified, a noble restraint and reserve permeate his art and reflect a truly Spanish temper.

His work may be classified according to four major periods: *Sevillian Period (1616-1623).* Velasquez painted his *bodegons,* a few religious pictures and several portraits. This work in general is marked by a search for, rather than assimilation of, fundaments of construction and character. He acquired his cool, silvery tonality, yet his modeling is strong with pronounced opposition of light and shade. His edges tend to be somewhat hard and his shadows lacking in transparency. He is not yet able to enfold his subjects in an embracive atmosphere although he acquires the capacity to control receding space. He displays little psychological penetration at this time. Examples: *The Maid Servant,* Chicago Art Institute; *Luis de Gongora, the Poet,* Boston Museum of Fine Arts; *Supper at Emmaus,* Metropolitan Museum, New York. *First Madrid Period (1623-1629)*— prior to first Italian journey. This is mainly a period of reorientation and search for personal expression motivated by his quest of natural appearance rather than formal schematic procedure. Friendship with the young King Philip IV grows and he makes his adjustments to court life. His works are well modeled and coldly impressive but show only the beginning of character analysis. No masterpieces result from this period. Examples: *Standing full-length Portrait of Philip IV,* Prado Museum, Madrid; *The Drinkers,* Prado Museum, Madrid. *Second Madrid Period (1630-49).* Velasquez spent two highly useful years of study in Italy (1729-30). He wisely neglected the Caravaggio's as foreign to his point of view. The art of Venice influenced him permanently in his assimilation of the Venetian artits' "compromise between decorative and optical effects." His work grows into a harmony of silvery tonal effects. His sense of composition is greatly strengthened and a new monumentality pervades his work. Effects of distance and enveloping atmosphere are successfully achieved. His portraits are distinguished by fine penetration and magnificent, carefully observed atmospheric quality with subtle distinctions drawn between indoor and outdoor lighting. His work grows in stately effects of great aristocratic beauty highly acceptable to the Spanish royal circle. Examples: *Self Portrait,* Palazzo dei Conservatori, Rome; *Joseph's Bloody Coat,* Church, Palace-Monastery, Escorial; *Forge of Vulcan,* Prado Museum, Madrid; *Surrender of Breda,* Prado Museum, Madrid; *Infante Ferdinand of Austria as Sportsman,* Prado Museum, Madrid: *Philip IV on Horseback,* Prado Museum, Madrid; *Infante Don Balthasar Carlos on Horseback,* Prado Museum, Madrid; *Infante Don Balthasar Carlos on Horseback,* Prado Museum, Madrid: *Infante Don Balthasar Carlos with Two Dogs,* Prado Museum, Madrid: *The Sculptor, Montañes,* Prado Museum, Madrid; *Philip IV,* Frick Collection, New York; *Portrait of Little Girl,* Hispanic Society of America, New York; *Coronation of the Virgin,* Prado Museum, Madrid. *Last Madrid Period (1650-60).*. The second journey of Velasquez to Italy (1649-51) resulted in his most magnificent and personalized achievements as a painter, growing in power and penetration until his death in 1660. A new and graver simplicity marks the triumphs of this last phase of his work, but his greatest achievement lies in his new interpretation of form built up with minute changes in lighting, that renders line almost needless and marks his works as the precursor of "Impressionism". He proves with his consummate mastery of the physical world with all its fleeting, atmospheric effects and subtleties of personal distinctions of rank and class, that he is the preëminent painter of the visible tangible things of earth, rather than of the mystical, glorified spirits of the other world.

Technically the work of this last period is built up in most economical terms. His paint is sparing, his glazes are infinitely thin, his handling is deft, sure and never hurried or impetuous. He died in 1660 at the height of his career. His life was one of calm dignity, constant security and success. Examples: *Pope Innocent X,* Doria Palace, Rome; *Calabasches,* Prado Museum, Madrid; *Aesop,* Prado Museum, Madrid: *Infanta Maria Teresse,* Boston Museum of Fine Arts; *Philip IV,* Prado Museum, Madrid; *Maids of Honor,* Prado Museum, Madrid; *The Weavers (Las Hilanderas).* Prado Museum, Madrid; *Venus and Cupid,* National Gallery, London; *Infanta Marguerite,* Prado Museum, Madrid; *Infanta Marguerite,* (bust), Weber Collection, Hamburg.

Bartolomé Estéban Murillo (1618-1682), an Andalusian painter, first studied with the mild-mannered Sevillian painter Juan de

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Castillo. The works of Roélas, Rubens, Van Dyck, Raphael and particularly Corregio influenced him. He is preëminently associated with Seville, where practically his whole professional life was spent except for a period of study of the Royal Collection at Madrid. His works in the past have been enormously admired, but now are regarded with perhaps even less interest than they deserve. His color sense is gracious as far as it goes—but it must be regarded as under-developed. His religious paintings are weakly sentimental and "pretty" rather than strong. In his portrait and narrative pictures he is seen to much greater advantage (*Prodigal Son among Harlots,* Beit Collection).

While Baroque in date, his style represents a blending of Renaissance and Baroque features. He is an exponent of the persuasive Jesuit style. His painting of flesh is often remarkably beautiful, with a fine, pearly tonality. Early pictures in general make use of a warmer palette than the later ones, which tend toward cool, silvery effects.

Examples, portrait and narrative: *Gallician Girl with Corn, c.* 1645-50, Prado Museum, Madrid; *John Tells His Dream to Liberius,* c. 1645, Prado Museum, Madrid; *Young Beggar Boy,* c. 1645-55, Louvre Museum, Paris; *Miracle of S. Diego or Angels' Kitchen,* 1646, Louvre Museum, Paris; *Old Woman Cleaning Head of Boy,* c. 1670-82, Alte Pinakothek, Munich; *Moses Striking the Rock,* c. 1674, Cathedral, Seville; *Prodigal Son among Harlots,* 1680, Alfred Beit Collection, London.

Examples, Religious: *Adoration of the Shepherds,* 1650-60, Prado Museum, Madrid; *Madonna and Child,* 1650-60, Pitti Palace, Florence; *Vision of S. Anthony of Padua,* 1656, Cathedral, Seville; *Immaculate Conception,* c. 1660, Provincial Museum, Seville; *The Child S. John with Lamb,* 1660-70, Prado Museum, Madrid; *Virgin of Seville,* c. 1670, Louvre Museum, Paris; *Soultā Immaculate Conception,* 1678, Louvre Museum, Paris.

Juan de Valdēs Leal (1622-1690), an Andalusian painter, pupil of Antonia del Castillo and bitter rival of Murillo, is potentially an original and gifted artist who failed to fully express his native capacity. Often guilty of understudy in his compositions, he still has left us highly interesting works that in some instances (*Dead Bonaventura,* and *In the Twinkling of an Eye*) are consummately expressive of the Spanish temper. His color is rich, his construction solid and there is often a fine energy and dramatic quality in his pictures. After Murillo's death, he ranked as the leading Sevillian painter. Examples: *Temptation of S. Jerome,* 1657, Cathedral, Seville; *Dead S. Bonaventura Finishing His Life of S. Francis,* Sir Robert Cook Collection, Richmond; *Hieroglyphic of the End of our Days,* c. 1670, Church of the Hospital de la Caridad, Seville; *In the Twinkling of an Eye,* c. 1670, Church of the Hospital de la Caridad, Seville.

EIGHTEENTH CENTURY. The principal figures of this century are foreigners with the exception of Goya (1746-1828). The native creative impulse was at low ebb and Spain imported such artists as René and Michel-Ange Hoûsse, Giovanni Battista Tiepolo, Louis-Michel Van Loo, and Raphael Mengs. Native artists such as Luis Menéndez (1716-1780), Paret Alcázar (1746-1799), Goyas' Master, Francisc Bayeu (1734-1795), José Castillo (1737-1793), Mariano Maella (1739-1819) and Gregorio Ferro (1742-1812) were for the most part followers of either the foreigners working on Spanish soil or (at the end of the century) of Goya. The art of Goya is by far the most significant achievement in Spanish painting of the 18th and early 19th cent.

Francisco Jose Goya y Lucientes (1746-1828), an Aragonese painter, studied first under José Luzán y Martinez (1710-1785) and then under his future father-in-law, Francisco Bayeu y Subias (1734-1795). He studied in Italy in 1769-17. His early work was influenced by Raphael Mengs, Luca Giordano and Tiepolo. He was appointed Royal Academician in 1780. His own vigorously personal manner emerged (c.1785) and captivated the Spanish court to which he was appointed in 1789. Mural painting, portraits, genre, satirical and political painting, etchings, and tapestry designing all claimed his attention. His work subsequently proved an important influence on such later 19th cent. French innovators as Daumier, Manet and Cezanne.

His work may be divided into three main periods: *First Madrid Period* (*1772-1799*). His style is influenced by Mengs, Giordano and Tiepolo. Grey-green color schemes, thin, liquid brush work, pale, slightly modeled flesh tones predominate. Examples: Frescoes in El Pilar Cathedral, Zaragossa; Frescoes in S. Antonia de Florida, Madrid; *Don Sebastian Martinez,* Metropolitan Art Museum, New York; *Josefa Bayeu, Goya's Wife,* Prado Museum, Madrid; *Witches' Conventicle,* Collection of the Duke of Osuna, Madrid; *Duchess*

*of Alba* (standing), Palace of Liria; *Maja Nude,* Prado Museum, Madrid; *Maja Clothed,* Prado Museum, Madrid; *They Cut Each Others' Nails* (etching). *Second Madrid Period (1800-1808).* This period is marked by a great coloristic advance. Warm whites, blues, crimson, gold and black sift and scintilate with wonderful, broken intensities, yielding a splendid impressionistic quality. The satirical quality grows and plays havoc with royal dignity. The brush work is forcible and a heavy impasto accumulates. Examples: *Family of Charles IV,* Prado Museum, Madrid; *Queen Maria Luisa* (standing), Prado Museum, Madrid; *Queen Maria Luisa* (three-quarters length), Prado Museum, Madrid; *Dona Isabel Corbo de Porcel,* National Gallery, London; *Isidoro Maiguez, the Comedian,* Chicago Art Institute. *Final Madrid Period (1808-c.1824).* This period is broken up by his dramatic, almost morbid reaction to the War of 1808-1814, his adjustment to the Bourbon Restoration government of Ferdinand VII (after the reign of Josef Bonaparte) and his sojourn in Bordeaux and his eventual death on French soil. Artistically this work is marked by a simplification in form, composition and color. Frequently he attains surprisingly rich effects by using only black, white, and brown. He strives for an increasing monumentality of form. Toward the end of his life he takes to painting with the palette knife. The mood is often combre or melancholy. It is this period that yielded such definite influence on 19th century French impressionism. Examples: *Scenes from the "Second of May" series—Citizens of Madrid Being Shot Down by the Troops of Murat,* Prado Museum, Madrid; *Hanging of the Monk,* Art Institute of Chicago; *Majas on Balcony, Metropolitan* Art Museum, New York; *The Forge,* Frick Collection, N. Y.; *Self Portrait,* Academy of S. Fernando, Madrid; *Frescoes from Goya Residence,* Prado Museum, Madrid.

NINETEENTH AND TWENTIETH CENTURIES. The early part of the 19th cent. is dominated by the later work of Francisco Goya (discussed under the 18th cent.). Other work roughly follows the pattern of painting in France beginning with the Classicism of David and continuing through Romanticism, Impressionism, Expressionism and the subsequent phases, inclupding Cubism, Surrealism, and Abstractionism, that motivate contemporary International Art. This long and varied cycle of developments stimulated the production of paintings of historical, literary, narrative, landscape, still-life, and portrait subject matter. From there it went on to psychological analysis, attempts to express the underlying factors of the Old Masters in a contemporary idiom. Problems of light, form, mass, gravity, dream subject matter, and pure design are investigated in new and daring ways. Certain contemporary Spanish artists such as Picasso and Salvatore Dali have risen to positions of great importance in international art circles. The influence of Picasso must be reckoned one of the most vital art forms in the world today.

*SCULPTURE.* While sculptural remains such as the bronze busts from Ampurias and architectural sculpture survive from the period of Roman Occupation and interesting Byzantinesque sculptural details from such Visigothic structures as San Miguel de Lino, San Juan de Baños, San Pedro de La Nave and those at Mérida, the main stream of development begins with Romanesque work. From this time on Spanish sculpture is now recognized as of genuine importance and high aesthetic interest.

ROMANESQUE (11th to end of 13th cent.). The general character of Romanesque sculpture in Spain from the latter part of the 11th cent. relates to certain phases of corresponding French work. However, critics are still divided as to whether the influence stemmed from France or Spain (q.v. Porter). The fact remains that the Cluniac (q.v.) Order was a means for the transference between the two countries and the churches of the Pilgrimage Road tended to be a unifying factor. The Entombment and the five related panels (late 11th cent.) in the cloister of S. Domingo de Silos, in common with those of Moissac in France, show a strong linear hieratic conception probably based on Spanish Moslem ivories. The 12th cent. work in general shows a compositional advance. Drapery tends to be somewhat more naturalistic in treatment and, though still stylized, is more plastically felt as in the Descent from the Cross, S. Isidoro at Leon; the early Fuerta de Platerias and the later Puerta de Gloria both at Santiago de Compostella; S. Vincente at Avila and the Apostles from the Camera Santa at Oviedo Cathedral. While examples of original polychromy are exceedingly rare, evidence points to its widespread use in sculpture from roughly the middle of the 12th cent. on. The work of the 13th cent. shows a heightened, though still essentially restrained, sense of movement; less stylization is felt in anatomical feature

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

but the general spirit is still definitely Romanesque. Examples include the Deposition group from S. Joan de las Abadesas; figures from the South Porch of S. Vincente, Avila; a tomb in the church of the Magdalena, Zamora; certain of the tombs in the Cloister Chapels, Old Cathedral, Salamanca and the Crucifixion Group at S. Andres, Cuellar.

GOTHIC (end of the 13th to end of 15th cent.). The Gothic spirit expressed itself tardily in Spain and the early work here corresponds to the 13th cent. French Gothic style, which was introduced mainly by the Cistercians. The new spirit is characterized by a more naturalistic though still idealized handling of features, body proportion and drapery; a growing sense of movement in the freer postures of figures and a new sense of grace. Examples include the South Transept Pork at Burgos Cathedral; the tomb of the Infanta Doña Blanca, Cathedral of Pamplona; and the West Porch sculptures of the Cathedral of Leon. At about the beginning of the 15th cent. a marked change developed in Spanish Gothic sculpture. A richly elaborated method, akin to contemporary northern work, marked by flowing lines, more animated descriptive quality and a less functional, more surface character, accompanied by a markedly increased realism identify this phase. Numerous retablos, choir stalls, chantries, and rich tombs become popular. Sculptors from Burgundy, Flanders, and Germany practice alongside native sculptors frequently signing their work and taking pride in personal expression. Examples are numerous and include: The imposing retables of La Seo, Saragossa; and that of S. Thekla, Cathedral of Tarragona; the tombs of Juan of Aragon in the Cathedral of Tarragona, and Lope de Luna in aL Seo, Saragossa; The Holy Sepulchre Group, Church of Réal Perpignan and the Retable of the Cartuja of Miraflores at Burgos.

RENAISSANCE (late 15th to early 17th cent.). Early Renaissance sculpture in Spain at the start maintains a connection with the late Gothic and finally achieves full renaissance expression. Both foreign and native artists are importantly employed. The former include Miguel the Florentine, Francisco Nicolosso Pisano and the more renowned Pietro Torrigiano. Damian Forment (died 1535), working in Valencia is representative of the latter. His final style is highly Italianate and relates to the manner of Donatello. He executed the Retable for the Pilar church at Saragossa (c.1510) and the tomb of Marquis Vasquez d'Arco (c.1520). With Forment may be classed the Sevillian, Pedro Millan (active from 1505) who shows Flemish influence in his important Virgin del Pilar at Saragossa. Philip Borgoña (died c.1543) although of a Burgundian family settled in Burgos, occupies an important place in early 16th cent. Spanish sculpture. His style is markedly Italian, once the Gothic survival found in his early work is passed, as in his Retable (c.1520) for the Royal Chapel, Granada and in his collaboration with Berruguete on the Choir Stalls in Toledo Cathedral. The *High Renaissance* is largely dominated by Alonzo Berruguete (c.1486-1561), who after being strongly influenced by the style of Michelangelo during his long study in Italy, returned to Spain as Royal Sculptor (1520) to Charles V. He personalizes the rich, plastic, powerful conceptions of Michelangelo by infusing a dramatic exaggeration of movement that yields a high emotional and religious expression of great intensity. His appeal to Spanish taste was so marked that his style extended itself to many of his contemporaries and is continuously felt to our own time in subsequent work. Among the large number of sculptures assigned him are his collaborative work with Philip Borgoña on the Choir Stalls of Toledo Cathedral (finished 1543); the rich tomb of Archbishop Tavera, Toledo; the tomb of Juan de Rojas and his wife at Valencia and the sculptures (early) for the Monastery of S. Benito Real, now in the Valladolid Museum. Bartolomé Ordonez (died 1540), a Catalan sculptor, embodies a strong Italian influence less adjusted to Spanish taste than Berrugueteś. His influence in consequence was more limited. While difficult problems of attribution exist, the Royal tombs at Granada (c. 1522) are in the main regarded as his work as is the Don Juan Tomb in S. Thomas, Avila. Gaspar Becerra (1520-1571) worked for a large part of his professional life in Italy. Like Ordonez, he is primarily Italian in his point of view. The influence of Michelangelo is dominant in his style. He is noted for his anatomical knowledge and rich plastic conceptions that are emotional in organization but without deep religious insight as in his S. Jerome, Cathedral of Burgos and the Retable in the Cathedral at Astorga. Juan Juni (1507-1577) is an important follower of Alonso Berruguete and capitalizes on strong emotional effects and marked exaggeration of movement to intensify his conceptions as in his Entombment group in Segovia Cathedral.

BAROQUE (17th to middle 18th cent.). In the judgment of conflicting critics Spanish contribution to Baroque sculpture is either marked by highest national expression and accomplished individualism or by pietistic excess coupled with oppressive realism carried to the ultimate. The fact remains that the 17th cent produced works of admirable quality that compare favorably with contemporary work produced elsewhere in Europe. The latter part of the period under discussion should be identified with Rococo production and it is here that the real decline in taste manifests itself. The first outstanding sculptor of the period is the Castillian painter, Gregorio Fernandez or Hernandez (1566-1636) who achieves a fine unmannered baroque spirit. Master of form and movement, he seeks an evocative realism heightened by a more restrained use of polychromy than was current in the works of such sculptors as Juan de Juni. His use of crystal for such detailing as eyes and tears met with favor at the time and was continued by subsequent sculptors. His Retable of S. Jerome at Santiponce; his Virgin of Sorrows; and his Baptism of Christ, both at Valladolid are expressive of his style. Juan Martinez Montañes (1564-1649), the Sevillian sculptor and contemporary of Hermandez, displays an admirable technical knowledge which he dericted toward realism coupled with piety and taste. A deep religious conviction is resident in such of his works as the S. Bruno at Cadiz Cathedral, the Immaculate Conception at Seville Cathedral and various Saints in the Museum at Seville. Among the followers of this tradition which include Alonzo de Mena, Alfonso Martinez, and Juan Gomez, the most important is Alonso Cano (1601-1667). Primarily associated with Granada and Seville where he studied under Montañes, Cano's style is an extension of his master's. He achieved acclaim both as sculptor and painter. Among his achievements in sculpture are the S. Anne, the Virgine and the Infant Jesus in Granada Cathedral; the S. Bruno in the Carthesian Monastery at Granada and the Virgin in S. Ana at Granada.

The Spanish love of realism and piety at this time lead to unfortunate excesses. The use of crystal for eyes and tears to evoke lifelike effects was extended to include the use of real eyebrows and, in certain instances, sculptors superseded polychromed drapery by real fabrics. In these latter instances only exposed parts as the head, hands, and feet might be sculptured, the rest being covered with stuffs. The last stage in realistic expression is unpleasantly revealed in statues equipped with mechanisms that allowed hands to move, etc.

The 18th cent. was a busy period in sculptural production marked by native pietistic works alongside numerous productions of French and Italian sculptors working in Spain. The native group includes Alonso de los Rios, Juan de Villanueva, Salvator Carmona, Juan Alonso Villabeille, Uuis del Peral, and the prolific Francisco Salzillo. The foreign group was headed by Robert Michel, Director of the newly-formed (1752) Acaddemy of S. Fernando. The predominating character was largely derived from contemporary French work with some stemmings from the style of Bernini. In general the old spirit of religious intensity is replaced by a mundane grace and charm lacking in both vitality and indigenous expression.

NINETEENTH AND TWENTIETH CENTURIES. The pattern of development in Spanish sculpture from the beginning of the 19th cent. to the present may de described as international. In the main, each of the current tendencies prevalent in France (and thence reflected to other parts of Europe) found adherents in Spain with only a few of the noted practitioners falling back to native inspiration. The first half of the 19th cent. is largely guided by the spirit of academicism. Its practitioners include José Ginés, Jose Piquer, Jose Alvarez, and Francisco Mortilla. Later in the century a more eclectic spirit prevailed that included medieval, Renaissance, Baroque, Rococo, Classic, and Romantic inspiration. Prominent sculptors include Manuel Ohms, Augustin Querol, Ricardo Bellver, Eduardo Barrón and Mélida. The end of the 19th and the early 20th cent. is marked by realism pushed almost to the photographic as in the work of Miguel Blay only to give way as the century progressed, to more subtle and impressionistic interpretations based on the influential work of Rodin as in the work of José Clará. The work of the most progressive contemporary sculptors reflects the varying important international tendencies as from such foreign masters as Bourdelle, Maillol, Mestrovíc, Brancusi, and others.

*THE MINOR ARTS.* Spain occupies a distinguished position in the realm of the minor arts. Her metal work at its best equals the general quality of production of any other European country. In wood working, ceramics, and textiles her evident achievements are acknowledged.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

METAL WORK. Rich in mineral deposits, Spain early developed skill in manipulating golds, silver, iron, and bronze into works that are a true index of her artistic capacities. In the Roman period she was noted for her skillful produtcion of iron and bronze weapons of great strength and durability as well as domestic utensils, brooches, and buckles. Remains found at Cordova, Santisteban del Puerto, and Mogón tells us of splendid articles for silver table services with richly embossed exterior surfaces joined to plain interiors with a filling of lighter metal between the two shells as was common in Rome. In general, designs also followed Roman precedent.

In the Visigothic period there was a general rejection of Roman designs or what elements that were retained are debased and lose their classic character. Geometric and linear floral motifs, both raised and flat, in repeated formation are current. Iron jewelry inlaid with gold and silver, and bronze buckles sometimes ornamented with gold occur. Objects of precious metal were sometimes richly worked, inlayed and mounted ith cabochon jewels massively set or hung as pendants recalling Byzantine work as in the Visigothic votive crowns from Guarrazar, now at Paris in the Cluny Museum. In the Romanesque period forged iron church grilles of repeated scroll motifs, and fine hardware elements were produced. The importance of the crafts is evidenced by the founding of the Ironsmiths Guild in Barcelona in the year 1200, a full two centuries before a similar French organization. Important doors were sheathed with bronze or iron plates enriched with die-stamped designs and mouldings as in the sacristy door of Seville Cathedral. In the Gothic period a wealth of utilitarian objects were produced. The decorative effect was enhanced by the use of a whole grammar of ornament including plant forms, pierced decoration and laminated relief work. Metal grilles became imposing architectural elements enriched with repousśe, pierced and embossed ornaments as in the early 16th cent. chapel grille at Cuenca Cathedral. Precious metals were worked into imposing architecturally designed relinquaries, custodia caskets and even thrones as the silver throne (15th cent.) of King Martin of Aragon at Barcelona Cathedral, the sumptuous silver relinquary in Jaen Cathedral, the smaller but important relquary in Pamplona Cathedral and the delicately wrought gold and jewelled so-called crown of S. Ferdinand in Seville Cathedral. Productions of the 15th and 16th cents. mark a high point of achievement.

In the Renaissance, classic motifs begin to appear sporadically at the end of the first quarter of the 16th cent. Grille designs increase in architectural quality and become more third dimensional with the use of classic columns, entablatures, *en ressaut* and early renaissance sculptural motifs of small flowers and arabesques (Italiante) as in the grille (c.1523) of the Condestable Chapel, Burgos Cathedral. These grilles were often built of metal plates applied to a structural wood core, because of the thickness of their individual parts. Important tomb sculpture, groups and independent figures were produced. Both cast and chiseled ornament, some polished and some unpolished, are all found in the same piece of precious metal, producing effects of great variety and beauty. Designs are complex and evidence great technical skill. As the century progresses a fuller renaissance spirit reveals itself in larger scale use of classic figures, floral swags, friut, animals, medallions and classic architectural elements. The end of the 16th cent. saw this tendency culminate in work of an austerely classic and coldly correct design quality as a result of Herrera's influence (q.v. Renaissance Architecture). The 17th cent reveals a decline in taste in the counter movement against the Academicism of Herrera. Work becomes almost oppressively rich in ornament involving the unrestrained use of naturalistic forms in great excess. The 18th cent. proved to be obviously influenced by contemporary France and followed the succeeding movements there that moved through the rococo and eventuated in the dry classicism of the style of Louis VXI. The 19th and 20th cents. were influenced by industrialization but various successful efforts have been made to maintain the crafts. Damascened work continues to thrive and the general tendency of the other crafts may now be described as marked by international tendencies.

CERAMICS. Evidence points to Spanish production of varied pottery in Roman times mainly influenced by contemporary types prevailing at Rome. The Visigothic period produced in the 8th cent. fine enamels laid on bronze recalling Byzantine precedent. Both incised and stamped decoration occurs on their pottern forms. The Mohammedan invaders executed important pottery at various noted centers in Spain. Their work is marked by rich, fine-scale ornaments based on stylized foliage and interlacing motifs sometimes in-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

corporated inscriptions. As in the famous Alhambra Vase, red, white, green, yellow and blue are employed with varied enamels, slip glazes and metalic lustres. Important examples of Romanesque and Gothic pottery remain involving fine glazes and metalic lustres. Designs in general are marked by bold organization of large scale vigorous elements someties united with small scale motifs. Interlacing foliage, armorial devices and decoratively employed mottos occur on vessels of rich and varied shapes. Decorative tiles enriched with enamels are noteworthy, sometimes designed as single units or as interlocking designs for running motifs or as parts of larger patterns. Renaissance elements of decorations become frequent in the 16th cent. They stem from Italian Majolica sources as in the tile painting of the Tuscan, Nicoloso Francisco who worked in Seville in early years of the 16th cent. A tile painting by him depicting The Visitation to the Virgin (now in Amsterdam) shows the scene spread over a group of tiles (as one area) recording an early renaissance knowledge of pictorial composition. **Talavera** and related wares become increasingly important after the early 16th cent. They are marked by exceptional boldness and vigor of design including splendid, swiftly-indicated bird and animal forms and heraldic devices in conjunction with floral and strapwork motifs. Blue, purple and orange frequently occur. The 17th cent. work is in general marked by a loss of vigor and spontaneity. Designs become more naturalistic, are drawn in greater detail and appreciation for narrative subject matter is shown. The palette is enlarged and includes strong greens and yellows, purple, and a rather neutral blue as shown on The Bull Baiting Bowl in the Victoria and Albert Museum. The 18th cent. ushers in French influence in the founding of the **Alcora** Potteries which employed French designers. An appreciation of fine scale ornament in elegant devices is evident following the manners respectively of the Regncy, Louis XV and Louis XVI. Blue and white ware is common as are richly polychromed work involving organizations or orange, blue, purple and green. Floral motifs and figure groups set in rococo inframements are frequent. Faïence, lead glazed ware and porcelain in variety of forms were produced as in the fine bowl and cistern in the Victoria and Albert Museum. The work of the **Buen Retiro** Porcelain Works dates from the middle of the 18th cent. and represents a continuation of the Naples Royal Porcelain works of Capo di Monte with a concurrent influence from Meissen productions in Germany. A Spanish quality soon modified these designs in a bolder, more sparing form sense and more thooughtful use of color. In general the designs followed the trends in France through the rococo to the staid and somewhat unimaginative classicism of Louis XVI. Fine glazes and enamel work are revealed in the numberless ornamental figurines, **urns,** group pieces and moulded wall panels that were produced, involving figures of the *Fêtes Galantes* as in the Porcelain Chamber of the Royal Palace at Madrid and in the Porcelain collection at the Prado Museum in Madrid. Due to a tendency to easily fracture, the output at Buen Retiro was largely confined to pieces serving a decorative purpose. The productions of the porcelain factory of **Moncloa** were likewise of note, producing among other objects, porcelain plaques of considerable distinction as in the Hercules panel in the Prado Museum, Madrid. The 19th cent. saw the spread of commercial production with a counter movement exerting itself in the 20th cent. to restore the native craft at such centers as Segovia under the enlightened direcion of contemporary artists.

TEXTILES. *Silk Stuffs.* Our knowledge of the production of Spanish textiles prior to the coming of the Mohammedans is obscure and considerable subsequent uncertainty is acknowledged. During the period of their occupation it is difficult to separate their exceedingly important work from Christian production as the Mohammedans frequently supplied rich stuffs to the Christian nobles and even the clergy. The magnificence of their productions are evidenced in important museum collections here and abroad (q.v. Kendrick in Burlington Monograph). With the unification of Spain under the Catholic monarchs at the end of the 15th cent., Spanish textiles were influenced by the famous Italian brocades and cut velvets. Sumptuous designs with large scale motifs supported by small scale elements such as the palmette, the opening pomegranate, small scale foliage, vines, heraldic lions and other animal forms occur in well ordered arrangements. A rich color sense controls these productions utilizing combinations of red, green, yellow, blue, white, gold and silver. Church vestments attain the highest degree of richness through the use of silk brocades or velvets embroidered with gold galoon worked in high relief. Orphreys embroidered with saintly personages in multicolors and richly framed in galoon ornaments

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

enrich the chasubles and related accessories. In some instances precious jewels were lavishly used in these embroidered ornaments as those preserved in the treasury of Toledo Cathedral. Chair backs, altar stuffs, hangings and covers of various sorts testify to the richness and beauty of these worked fabrics. *Tapestries.* Weaving of tapestries in Spain began in late Gothic times through contact with the great Flemish centers of Arras, Brussels and Bruges. Both high warp and low warp looms were employed. The general method, both technical and artistic, largely followed these great predecessors except for some departures in draughtsmanship, subject matter and color sense. The sequence of stylistic changes from late Gothic through renaissance, baroque and rococo are recorded here. Splendid examples of these are found in the famous collection of El Pilar in Saragossa, the Cathedral of Burgos, the royal and various private collections. In the 18th cent. French influence, as usual, is to be noted in the royal tapestries designed by Goya and now preserved in the Prado Museum, Madrid. *Carpets.* Rug weaving was an important craft in Spain from late Gothic times to the present. Near Eastern methods were employed with some variation as making the knot on single warp threads (q.v. Kendrick and Tattersall) to facilitate fine linear motifs. Great variety of design is met in these productions. Armorial carpets involving the Arms of the patron set on a field of small, repeated motifs were frequent in late Gothic productions but few of these have been preserved. Geometric designs and tile motifs were employed, as well as traditional near Eastern organizations and the decorative elements derived from the contemporary silks and brocades following the principal evolution in these to the present.

carpets—by A. Van de Put. A. F. Kendrick and C. E. C. Tattersall, *Hand-Woven Carpets*, 1922. —J.G.V.

**spall or shiver.** In masonry: A chip, splinter, or flake, as from a stone, usually worked off in dressing.

**span.** The distance between supports, as of a roof or beam.

**spandrel.** The space between the top of a window or wall opening and the bottom of the one directly above it. Also the space above the springing of an arch and a horizontal line through the top of the arch.

**SPANISH ARCHITECTURE IN THE NEW WORLD.** As was to be expected, Renaissance Europe strongly moulded the beginnings of Spanish architecture in the New World. The Gothic renderings of the early 16th cent. in the Americas show distinct evidence of Romanesque strength. The *conquistadores* imported Moorish workmen of superb skill from a Spain glad to be rid of any Moor; as the 16th cent. advanced, these craftsmen imposed florid touches which came to be known in some places as **mudejar** (Moorish-influenced) architecture. The same century saw the development of what was called the plateresque—a Spanish term describing the practice of relieving barren medieval expanses of wall with door- and window-openings as intricately-ornamented as fine silver. In the Colonial Americas, woodworking reached its zenith in the huge carved Renaissance **retables**, or **altar pieces** (q.v.), which usually covered one end of the church by the beginning of the 17th cent.

The architecture of the Americas passed through a brief phase of classical severity in the latter years of the 17th cent., then blossomed into elaborate baroque. Painting and furniture, too, evolved baroque intricacies.

The style known as **churrigueresque** superseded baroque during the first half of the 18th cent. Here, the practice of ornamenting standard architectural forms with baroque superlatives gave way to an overwhelming play of sheer design, in which rhythm and movement dominated and the emphasis upon structural elements was smothered in decoration. Everything from churches to residential furniture was ornamented in churrigueresque style. Fundamentally and intensively a religious expression, it was employed somewhat more conservatively in secular architecture.

The emergence of folk arts—typified by the advances in ironworking and in the making of colored glazed tiles—was the most important architectural characteristic of the latter half of the 18th cent. in the Americas.

The true Colonial period now drew to a close, accented by an unimportant classical revival. With it ended true Spanish architecture in the New World.

Early in the 19th cent., all the arts had declined in this hemisphere, and—save for certain localized movements such as that which produced the great present-day Mexican frescoes—there have been no outstanding architectural styles employed until the current use of "modern" geometric forms, so strikingly successful in Rio de Janeiro, Brazil, and in Montevideo, Urugay. —M.R.

**Spanish leather.** *Book.* A name used by many leather dressers and others for any bright straight grained leather.

**Spanish tango.** See tango.

**spanograph** (art ed.). Diagrammatic representation to illustrate graphically the comparative duration of time embraced in life spans of artists, and the elapse of time in comparative art periods. Whitford and Winslow in *Dictionary of Education.*

**spatial arts.** See space arts.

**spatular.** See ENAMELLING ON METAL.

**spectator.** See PERSPECTIVE.

**spectral sensitivity curves.** See COLOR.

**spectral transmission curve.** See COLOR.

**spectrophotometer.** See COLOR.

**spectroradiometry.** See COLOR.

**spectrum.** See COLOR.

**speech vibrato.** See VIBRATO.

**speed, in dance.** See movement.

**sphinx.** A being with a lion's body and a human head or the head of another animal.

**sphragistics.** The study of numismatic seals, their origin and design, covering ancient metal and stone signets and after the 12th cent. A.D. the wax and lead impressions of heraldic seals, on official documents, which often afford genealogists more accurate information than emblazoned arms. —T.E.F.

**spider.** See SYMBOLISM IN FAR EASTERN ART.

**spilled ink style.** See CHINESE ARTS.

**spina.** See circus.

**spinach-green.** A very dark green color. The term is most often used in the Orient to describe a certain color of jade, as spinach-green jade.

**spine.** *Book.* The modern term for the back of the book.

**spinet.** An obsolete keyboard instrument like the harpsichord, but small and square in form. See MUSICAL INSTRUMENTS.

**spiral.** An ornament in which a curved line moves continuously in ever-widening circles out from the center about which it revolves; common in all artistic styles, used in single and complicated forms. —L.T.S.

**spiritual.** See AMERICAN NEGRO MUSIC.

**splay.** A slanted surface or bevelled edge, as of the sides of a doorway or window, or of a joist. See reveal.

**Spode ware.** See CERAMICS II.

**spool drum.** See MUSICAL INSTRUMENTS.

**sposalizio.** Italian for "marriage". The term is the sobriquet for Raphael's famous picture in the Brera Museum at Milan, Italy. The picture relates the story of the wedding of Mary and Joseph. It was painted by Raphael in 1504 for the Church of St. Francis at Citta di Castello and remained there until the Napoleonic times (1798) when it was removed and brought to Milan. The picture is signed "Raphael Urbinas MDIIII" and was painted shortly after Raphael had left the studio of his teacher Perugino. There he had seen Perugino's picture, with the same subject, which is now in the museum at Caen, France, and by which he was undoubtedly influenced. But in Raphael's picture the subject has been infused with new life. The group of persons shows a vivacity of motion and expression quite new in the Umbrian school of that time. —L.L.

**spot zoning.** See CIVIC PLANNING.

**spout.** A tube or trough for discharging a liquid or other flowable substance.

**spreader.** See ENAMELLING ON METAL.

**springing line** or **springing.** The point at which an arch begins to curve over; usually a horizontal line.

**sprinkled.** *Book.* Like "marbled" this is usually applied to edge coloring and denotes that the edges have been cut and sprinkled with color. Generally all three edges are so treated and described.

**spruch.** See MEDIEVAL MUSIC.

**spun glass.** See GLASS AND GLASSMAKING.

**spur marks.** Marks on ceramic ware where the spurs or separators have adhered to the object and have been broken off after the object has been removed from the kiln.

**square.** See CIVIC PLANNING.

**square dance.** See American folk forms, in music.

**square nimbus.** See nimbus.

**square notation.** See NOTATION.

**squared paper.** Used as the translation of a water color sketch for a rug into a loom-pattern. Its beauty must not be marred or lost while adapting it to the little square on the loom pattern paper, which indicates each knot of worsted to be tied, and woven into the fabric. —B.E.J.

**squinch.** An arch, lintel, or beam carried across the angle of a square or polygonal structure to support a superimposed mass such as a dome.

**stadium, stadion.** See circus.

**staff** (*pl.* staves). *Mus.* See NOTATION.

**stage design.** A phase of theatre art pertaining to the designing of curtains, scenery, properties, costumes, lighting effects and stage sets in general. Whitford and Winslow in *Dictionary of Education.*

**STAGESETTING.** Stagesetting comprehends the organization and the whole complex of objects which help the spectator visualize the place and environment of action. These elements consist principally of four categories: (1) the **background** (either a fixed architectural built-up, or painted background or a movable and interchangeable painted backdrop), (2) the **lateral parts** (either a con-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tinuous architectural or painted wall or a sequence of **changeable flats** which may be perspectively painted and arranged or may represent just a sequence of interrupted architectural details), (3) **props** (individual movable objects like pieces of furniture or single painted or modelled rocks, trees, etc.), (4) **the proscenium**, an architectural or painted frame which separates the stage from the audience. The importance and the treatment of these four elements of stagesetting vary through the history of the theatre. However, stagesetting in the narrower modern sense of the word was not created before the time of the High Renaissance.

The ancient Greek theatre set its stage mainly by architectural means in developing the back wall with its three doors (see THEATRE ARCHITECTURE). Nevertheless, some painted scenery has been used although probably later than Vitruvius (2nd half of the 1st cent. B.C.) and Pollux (2nd cent. A.D.), the authors on whose works our knowledge of the ancient theatre is based, assume. Surely, since the end of the 5th cent. B.C. single painted props like rocks were used and also a kind of flat painted canvas (**coulisse**). Whether these paintings were already then done in any kind of perspective, is not clear. A more complicated system was represented through the so-called **"scena ductilis"** that means an arrangement of painted canvas one behind the other in a way that when one flat was drawn back the one behind appeared. Even changeable **periaktoi** (triangular revolving prisms) were arranged in connection with the stationary architectural background—probably besides the doors. Vitruvius described standardized decorations for the three types of theatrical plays: different architectural motives for tragedy and comedy, pastoral motives for satyr-plays. It is possible that these descriptions of Vitruvius were true more for his contemporary Roman theatre than for the real ancient Greek stage.

The technique of machinery was quite far developed, a series of specific devices was generally used. The most important device was a movable platform in semi-circular or square form which was pushed through the middle door and on which were placed the individual props representing an interior like a throne, altar, etc., called **ekkyklema.**

The Roman theatre developed and specified painted scenery much farther. Here the use of real perspective is sure since murals at Pompeii and other places have come down to us which imitate these scenic effects. So we have to suppose that these painted decorations were not in any way bound to the stationary architectural background (scenae frons) but varied freely.

The development during the Middle Ages cannot be considered as a continuous unity in the same sense as the Greek and Roman theatre. There is in every respect a greater difference between the 11th and 15th cents., between Spain and Germany, than between the 5th cent. B.C. and the 2nd cent. A.D. in Graeco-Roman civilization, and than between a theatre in Greece proper and in Southern France. All varieties of the liturgical drama or mystery plays took place first inside the church corresponding to individual ecclesiastic holidays. First small movable props were used and arranged before the altar such as the crib under a straw covered roof, the sepulchre of Christ, etc. Later simultaneous small boxes or scaffolds were arranged fitting into the architectural structure of the church which represented the various localities of the Holy stories. Only to a very small degree they were characterized by visual hints except the mouth of the Hell whose frame was always literally decorated.

When during the 14th and 15th cents. the play was shifted from the interior to the square before the church or the market place, the setting became much more elaborate. The various scenes became **"mansions"** like the Paradise, the City of Jerusalem, the Limbo, the Lake of Genezareth, the Heaven, and always the most favorite—the Hell. The individual guilds which had to care for the decoration competed by the accumulation of very realistic props and more or less primitively painted canvasses. In these painted decorations perspective was never used. The diversity of the places of action substituted for the visual stimulus provided later by the perspectival built-up and the change of decorations. All kinds of complicated machinery, from the flying device to fountains and burning hell-kettles, supplemented the realistic props and painted accessories. They became almost self-purpose during the 15th and 16th cents.

This development showed different aspects in the individual European countries. The English version represented in so far an exception as the individual mansions were put on wheels as a kind of richly decorated floats, whose succession substituted for the simultaneity of action in other European countries.

The stagesetting of the Renaissance developed from three sources which finally amalgamated. The rediscovered Roman comedies,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

mainly plays by Seneca, Plautus and Terence, were performed on stages which showed—probably unconsciously—still a variant of the medieval mansions. We know exactly by early illustrated editions of Terence about their appearance. Generally, it was a row of pillars with curtains in between. Behind these curtains small compartments represented different localities. These pillars were arranged either in one row, or as a half octagon or square-like. This form of representation lasted till the first decade of the 16th cent. Then the influence of the second root for the Renaissance theatre began to grow gradually. It was the rediscovery of Vitruvius with his descriptions of ancient theatres (see THEATRE ARCHITECTURE), of which many editions were published. Although the reconstructions by the leading Renaissance artists were not at all reliable in the sense of modern archeology, they at least paved the way for the use of perspective on the stage which had so far developed in the painting of the 15th cent. Perspectival backgrounds for the performances of Ludovico Ariosto's (1474-1533) *Cassaria,* Ferrara, 1508; for Bernardo Dovizio's—called Bibbiena— (1470-1520) *Calanda,* between 1504 and 1513, Urbino; some perspectival stagesettings by Baldassare Peruzzi (1481-1537). This perspectival rendering substituted for the simultaneity of the medieval stage. The third influencing factor were the "trionfi", "masques", "entries", or "ballets" of the 15th cent. These were festival processions with individual floats of allegorical decorations. They were composed by painted props, costumed actors who moved on complicated machineries using technical elements of the medieval mystery stage, augmented by artificial animals, etc. (e.g., Leonardo da Vinci's *Il Paradiso,* Milan, 1489).

The balance of these various influences can be seen in the stage as it was represented in Sebastiano Serlio's (1473-1554) *Della Architecture,* Venice, 1545. Serlio referred to the three different kinds of settings by Vitruvius for tragedy, comedy, and satyr-play (see above). The background was a perspectively painted backdrop. To the right and to the left of this backdrop individual flat, perspectively painted canvas were erected. Background and flats created the frame for the action.

Andrea Palladio (1518-1580) and Vincenzo Scamozzi (1552-1616) shared in the erection of the Teatro Olimpico at Vicenza, 1580-84 (see THEATRE ARCHITECTURE). Besides its architectural importance this theatre showed for the first time plastic stagesetting. Serlio's suggestions were now transferred from flat perspectival rendering into real three-dimensional settings. But these perspectival architectures, visible through three triumphal arches created only the background. The actors did not play within, but before them. The setting as such was not changeable.

Changeable settings at Italian theatres were achieved about the same time by the re-introduction of the ancient periaktoi, now called "telari" about which we are fully informed by the writings of the German architect Josef Furttenbach, the Elder (1591-1667) who explained carefully what he saw on the Italian stage of his time.

The final step was done in the Teatro Farnese at Parma, 1618-19 erected by Giovanni Battista Aleotti (1546-1636). Here we have only one large framing arch, the first modern "proscenium" instead of the three, resp. five arches of the Teatro Olimpico. Behind this main arch the rear part of the stage is not any longer filled by three-dimensional perspectively arranged settings but by a changeable backdrop and by two sequences of changeable painted side flats. In this way it was now possible to act there, on the rear stage, too. This invention means virtually the birth of modern stagesetting.

The following centuries, the 17th and 18th, represent the climax of stagesetting as an art for its own sake. Changeable side wings and changeable backdrops created the necessary instruments and possibilities. Stagesettings were considered so important that they were preserved in sequences of highly precious specific publications in copper engravings. In this way names and works of the leading theatre architects and stage designers came down to us. It is impossible to enumerate the names of even the most important among them. From the beginning of the century, designs by Alfonso Parigi (died 1656) and Guilio Parigi (1635), the disciples of Bernardo Buontalenti delle Girandole (1536-1608) and by Jacques Callot (1592-1635) are preserved in excellent prints. Their gift and knowledge were equally used for real plays, for the so-called *intermezzi,* for entrées, ballets and pageants. However, the greatest opportunity was given by the opera. Giacomo Torelli (1608-1678), the disciple of Aeotti, the builder of the Teatro Farnese in Parma, brought the achievements of the Italian stage to France where he worked esp. between 1650 and 1660. He was followed, among others.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

by Carlo Vigarini (1586-1663) and by the Venetian Francesco Santurini (1627-1682) who worked in Italy and esp. in Munich. Others were the brothers Domenico, Gasparo and Pietro Mauro, Venetians too, working through all Europe, esp. in Munich, around 1680-1690. Of greatest importance for this generation were Giovanni and his son Ludovico Ottavio Burnacini (1636-1707) who worked especially for the Austrian Emperor in Vienna. The technique of their rendering and the necessary machinery used by all these artists, were based mainly on the experience and theories of Niccolò Sabbatini (1574-1654), *Pratica di fabbrica scene e machine ne' teatri,* Pesaro, 1637. Without analyzing the stylistic differences between the individual artists it may be said that the scene was always symmetrically built and the main machinery usually combined with water plays or fireworks and flying machinery was arranged in the center. If any excuse could be found, pompous architectures were shown. Typical scenes like the "forest", an arrangement of symmetrical trees and bushes; "desert" and "ocean", "village" and "prison" followed the symmetrical scheme. The result was that the 17th cent. and still the first third of the 18th cent. showed more formal restraint on the stage than did the really built simultaneous Baroque architecture.

Italian architects led through the whole of Europe. France's Comédies du Roi and their chief artist Laurent Mahelot around the middle of the 17th cent. followed still the example of Serlio, sometimes relapsing even into the medieval manner of simultaneous rendering of different localities. However, these localities in themselves were now perspectively painted. Soon, the influence of Torelli and his disciples assimilated the French stage to the Italian.

The Shakesperian stage is too well known to be analyzed here. Anyhow, already in the fourth decade of the 17th cent. changing scenery stimulated by Serlio and Palladio appeared on the English stage. Of greater importance for the history of stagesetting in England than the real theatres were the "masques", the elaborate dramatic-lyrical court plays. It were these pretentious representations for which Inigo Jones (1573-1652) created his main works at the time of Shakespeare. He used the stimuli he had received from travelling in Italy. Technically he relied on the periaktoi, later on two-sided flats and finally, under the influence of the Teatro Farnese and of Sabbatini's theories, on changeable flats and backdrops. After the Restoration, men like Christopher Wren (1632-1723) and his assistant John Webb took over the Italian system entirely, and beyond that tried even to reform the theatre building itself (see THEATRE ARCHITECTURE).

In Germany and Austria, Italian designers produced Italian settings, sometimes richer than in Italy proper since the Emperor and the individual sovereigns spent large amounts of money on them (e.g., Vienna, Munich, Dresden). Peculiarly, there was almost no difference as to setting between the opera for the Emperor and the Intermedii on one hand and the religious plays staged by the Jesuits on the other hand, which were widely spread at this time as public amusement and propaganda.

A decisive turn was brought about after the first third of the 18th cent. by the genius of the leading stage designer of this time, Ferdinando Galli Bibiena (1657-1743). His work changed the stagesetting from its stiff architecturally organized symmetry to a loose, more spacious and principally *illusionistic appearance.* The way for him was paved by the perspectival illusionism of Andrea Pozzo (1642-1709). This virtuoso of perspective created successfully in his Teatra Sacra (large paintings for the decoration of churches for religious celebrations) and in his stagesettings the most illusionistic perspective with all refinements of Baroque deceptions. His tendency is an entirely naturalistic one and not any longer mainly defined by the desire to create symmetrical architectural views as those by earlier artists.

The last step, however, was done by Ferdinando Galli Bibiena, a member of the most famous family of stage designers Galli Bibiena who worked in four generations of the 17th and 18th cents. through the whole of Europe. This classic of stage design who did innumerable settings invented the angular perspective for the stage, *"maniera di veder le scene per angelo"* as explained in his main work *Architettura civile preparata sulla Geometria e ridotta alle prospettive,* Parma, 1711, and *Varie opere di Prospettiva,* Augsburg, 1740. The result was that from now on the spectator did not any longer look at the stage like into a room whose fourth wall is taken away but that he himself became included into the room which was represented on the stage. In this way the naturalistic illusion had gained immeasurably. The borderline between the auditorium and the stage was extinguished.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Ferdinando Galli Bibiena's principles were followed up by his sons and other relatives who exactly like he himself worked at almost any great opera house in Europe. The most important among them was Giuseppe (1696-1756) who superseded even his father in the luscious pomposity of his inventions (e.g., in his work *Architetture e prospettive dedicate alla Maestà di Carlo sesto,* 1740).

A reaction against the confusing overrichness of the new angular system started around the middle of the 18th cent., esp. in France. It was helped by the gradually development of classicist tendencies in architecture. The leading masters who worked in this direction were Filippo Juvarra (1676-1736) working mainly in Turin, and Giovanni Niccolò Servandoni (1695-1766) worked esp. in France and emphasized archeological and antiquarian moments especially. All these artists used the angular perspective by Ferdinando Galli Bibiena as well as the older type of symmetrical arrangement, however, both types always in a more academic manner than the Bibienas did in their exuberant baroque feeling. In France, Servandoni worked together with the painter François Boucher (1703-1770) who did many settings for the theatre of Mme. Pompadour and for the Opéra Comique. It should be mentioned that in the cooperation of these men Boucher painted sometimes figures on the wings done by Servandoni. This application of painted figures on architectural settings can still be found in the 1st third of the 19th cent. and Johann Wolfgang von Goethe (1749-1832) discusses intensely the aesthetic reasons for this combination. Servandoni and many other designers of this time did not only settings for operas but also arrangements for ballets, fireworks, and celebrations of the court. He even went one step farther inventing **"mute spectacles"** which showed only sequences of settings following each other through many hours, illustrating a specific story, accompanied by music. In this way he became the pioneer for the later **panoramas** and **dioramas.**

Archeological conceptions began to prevail more and more in the works of the Italian Giovanni Battista Piranesi (1720-1778) who displayed an exuberant imagination in the rendering of classical motives (*Prima Parte di Architettura e Prospettive, Roma,* 1743). His *"Carceri"* (prison scenes). Venice, 1770 typical stagesettings which he himself called "inventioni capricciosi" increased this spirit into the boldest visions. His spatial fantasy is even more audacious than that of Pozzo or Bibiena. He makes the spectator divine the space, without showing it directly. He even adds some moments of technical romanticism showing the most complicated machineries. His French counterpart is Gabriel Pierre Martin Dumont (ca. 1720-1790), like Servandoni a connecting link between the Italian and the Parisian classicism. Antonio Basoli (active between 1800 and 1820) is another very important Italian classicist whose *Raccoltà di prospettive serie, Rustiche e di Paesaggio,* Bologna, 1810, influenced the stagesetting through whole Europe. The family of Bernardino Galliari (1707-1794), Francesco Fontanesi (1751-1795), and Pietro Gaspari (1720-1785) belong into the same orbit and show the identical preference for complicated prison scenes, fantastic staircases, and romantic ruins. Towards the end of the 18th cent. Pietro Gonzaga (1751-1831), again a Venetian, took the lead through Europe and worked esp. for the court in Russia. His work *La musique des yeux ou l'optique du théâtre, Petersbourg,* 1807, gained an international reputation.

In Germany the Neo-classicism brought forth a great number of stage reformers, among them most important the famous architect Karl Friedrich Schinkel (1781-1841). His stagesettings show exactly like those of the last mentioned French and Italian artists an increasing interest in so-called "natural" gardens enriched by ruins and beyond the usual classical architecture even in the reproduction of Gothic buildings from a typically romantic point of view.

One more fact has still to be mentioned. Towards the end of the 18th cent. people felt that the dissolution of interiors into individual side wings was not realistic enough. They wanted to see closed sidewalls, too, besides the closed third wall, represented by the backdrop. We find attempts for this **box set** sometimes on English stages during the last three decades of the century and in France during the Revolution. Simultaneously some German theorists fought for it, while Johann Wolfgang Goethe declined it considering it one more consequence of Diderot's (1713-1784) naturalism.

The Romanticism and later on the Realism of the 19th cent. abolished the visual interest in the stage which had dominated during the 17th and 18th cents. and had produced so ingenious stage designers. There is not one individual artistic personality through the whole century who could be compared with the above mentioned artists. In spite of the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

progress of theatrical machinery and lightning, a dull combination of props and wings, sometimes archeologically true, sometimes not even that, gave just enough to make clear the locality of the action. Scenic design became an art again not before the beginning of the 20th cent. See MODERN STAGESETTING; also Allardyce Nicoll, *The Development of the Theatre,* London, 1937; George Freedley and John A. Reeves, *A History of the Theatre,* New York, 1941. —P.Z.

**stained edges.** *Book.* Color applied to edges of book to prevent dirt showing. Used in place of gilding.

**STAINED GLASS.** Generally considered to be a pictorial or decorative composition made by uniting various sizes and shapes of colored, translucent glass together with strips of lead. Detail and shading in the composition are painted in afterwards. Except for a wider range of colors and textures now available, in addition to certain minor technical developments, the art of stained glass making is very much the same today as it was in the 12th cent.

*Preparing the Glass.* All stained glass is blown. Molten glass is dipped from the furnace on one end of a blow-pipe. The glass blower puts the other end to his mouth and blows until a bubble is formed. The bubble thereupon is usually elongated, after which the ends are cut off and a cylinder is formed. This cylinder is in turn cut down one side, and the glass is reheated so that it can be opened out as a flat sheet upon a piece of asbestos or plaster of Paris. Sometimes, on the other hand, the glass bubble is put inside a square box and blown until it fills the box. In this method, because the glass first touches the center of each side of the box, it gets thinner at these points as the glass is blown out into the corners. Thus the glass is irregular in thickness, affording unusual possibilities for the artist.

Another method for making sheets of glass is to twirl the glass bubble until it forms a flat disc. This is called **crown glass,** and here, too, the glass is irregular, being thinner towards the edges and thicker near the center.

*Coloring the Glass.* The colors are obtained from oxides added to the molten glass. Copper oxide, for example, produces blue or blue-green depending upon the amount used, the composition of the molten glass, the temperature of it, the length of time the batch is heated, and so on. The variations obtainable from each oxide are infinite.

A **gather** or small amount of molten glass is obtained on the end of the blow pipe. This gather of clear glass is then dipped into another color of glass and a bubble blown. The colored glass forms a film around the clear glass bubble, and this is called **flashed glass.** The clear glass is used with the colored to prevent the colors, red and blue in particular, from appearing too dark for use in stained glass windows. Occasionally pieces of colored glass are further treated with hydrofluoric acid thereby producing glass of varying degrees of intensity, or **shaded glass.** Furthermore, two colors are sometimes stirred together slightly before being blown resulting in **streaked glass.**

*Designing the Window.* The artist who designs a stained glass window must continually think in terms of light. First, he should be intimately acquainted with the location of his window in the church or building under consideration. For example, there might be an adjoining building cutting off the sun from striking the window directly, or a tree located directly outside may cast shadows against it. It also makes a difference in which side of the building the window is to be, as a northern exposure where the sun never strikes, or a southern one with an abundance of sunshine. Moreover, the time of day the window is most often to be viewed is an added factor which the artist must take into consideration when he is designing in terms of light.

Because a window is part of the architecture of a building, the artist must treat it as such. Restraint in handling is thus called for. The brilliant colors have enough life in themselves to give vitality even though the window is compositionally conceived with monumental dignity rather than as a restless, quick-moving picture. In fact, to be true to the medium of glass, the artist will try to design in color areas rather than attempt to make a complete and detailed study.

As for procedure, the artist first makes a **sketch** of his window to scale, usually one inch to a foot. The plan is then enlarged to the size of the window, this drawing being called a **cartoon.** Finally an **outline** is made on the cartoon to show the position of the lead strips.

*Making the Window.* The **cutting** of the glass is usually done on a wheel with the outline serving as guide. The wheel cuts a crack in the top of the glass which deepens

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

when the glass cutter taps the glass from the underside. The important part of the process here is to see that the glass gets cut accurately, and does not chip or splinter. Because of the various sizes and shapes needed, about two-thirds of the colored glass cut is waste although some of it is subsequently reheated and used again.

After the required pieces of colored glass are all cut, they are arranged on a sheet of clear glass, and adhered by hot wax applied at the corners of each piece. This is called **waxing-up**, and when thus located, the glass is ready for the next step, that of **painting.** Using a pigment of one color, consisting of powdered glass melted and mixed with copper and iron oxide, desired detail and shading are now applied to the colored glass.

These painted pieces are in turn **fired** in an oven at a temperature between 400 and 500 degrees Centigrade, the pigment melting and becoming a permanent part of the glass. **Staining** comes next. Silver chloride is applied to the back of the glass, forming a yellow stain, and the glass is fired once again. After firing, the pieces are assembled on the outline and the **leading** takes place. The workman puts the prepared strips of lead in between the pieces of glass, bending the edges to form a **flange** or rim to hold the glass, and soldering the places where the lead strips meet. Finally he works in a kind of cement under the flanges, making the window watertight.

*The History of Stained Glass.* The exact origin of stained glass is not known. It is believed that it dates back no farther than the 9th cent. with probable origin in the Near East. The art spread to Italy and it is estimated that by the 10th cent. Venice was the center of stained glass making.

The first record of pictorial windows is a manuscript giving an account of the various stories illustrated in the windows of Rheims Cathedral rebuilt by the bishop from 969 to 988. The use of lead in stained glass windows is initially referred to in Mâlés *Miracles of Saint Benoit* in the Church of Fleury-sur-Loire.

Most of the windows of the 11th and early 12th cents. were of the one window type, consisting of one monumental figure in each window, but about the middle of the 12th cent., two or three windows were combined within one frame to represent incidents in the life of Christ or one of the saints. After this departure still larger windows developed and thus the architecture of the time was influenced in turn. Specimens of 11th cent. stained glass can be found in Augsburg Cathedral, Germany, and Le Mans, France, and of the 12th cent. at York, Canterbury, Chartres, and Bourges.

By the 13th cent., more attention was paid to the colors used in the windows, and greater detail was painted in with lines. Borders, too, were undergoing a change at this time from the simplified, classical motives to more natural, representational leaves, vines, and scrolls. **Grisaille painting,** or decorative painting in grey monotone, in which foliage patterns were painted in grey, black, or brown enamel on large, clear areas of glass, had developed by the latter part of the 1200's. Examples of 13th cent. stained glass may be found in some windows at Canterbury, Chartres, and Bourges, as well as at Lincoln, Sens, Cologne, Rouen, and Le Mans.

It was during the 14th cent. that a movement towards naturalism in stained glass reached its height. Instead of the earlier idealized abstractions the figures began to be individualized as if they were the friends and acquaintances of the glass designer. Flowing curves were now introduced for the eyes, hair, and lips, as well as for the folds in the garments. The clothes, in fact, bore resemblance to the contemporary fashions. By the end of the 14th cent., even perspective was employed a great deal for the natural effect it afforded.

The 15th cent., on the other hand, saw the decline of naturalism. Somewhat nondescript leaf forms replaced ivy and vine patterns. Gradually heraldic designs developed as decoration. The technique of scratching the design of a shield, for example, into the glass came into use along with the further development of symbolic designs painted with the brush. Individualism in glass treatment also came to characterize the stained glass of this era. Various local "schools" sprang up around talented artists all over Europe, each deviating slightly from the accepted and more or less standard stained glass design of the past. Also about this time, as painting became more important than architecture as an art, stained glass workers tried to make their production look like painting, thus violating the integrity of the glass medium. This resulted, therefore, in an unfortunate influence on stained glass making for an indeterminable period to follow.

During the 16th cent., windows developed as large pictures;—to be viewed as one large canvas. A master of this technique was Bar-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

nard Flower who came from the Netherlands to England to execute the windows for King Henry VII at Westminster as well as four windows for King's College chapel at Cambridge. Other important stained glass windows of this period are at Rouen, Marne, Dreux in France, Antwerp, Gouda, Amsterdam, Brussels, and Liege in the Netherlands, Augsburg, Strasbourg, Cologne, and Nuremberg in Germany, and at Rome, Florence, Milan, and Arezzo in Italy.

Switzerland reached the peak in a type of stained glass painting in the 17th cent., by the use of it in almost every home. A social art, oftentimes taking the place of a painting on the wall, the glass design became intimate, and, for viewing at close range, became fine and delicate. Here, too, the technique of stained glass became more like that of painting.

In the late 18th cent. a Gothic revival developed. Because the Gothic styles were copied without the inspiration or rationality with which they were first created, the result was stained glass produced according to formula. Revolting against this in the 19th cent. was William Morris, who encouraged once again creativeness rather than indiscriminate imitation. Working with Morris was Burne-Jones, and together they produced windows for the Christ Church, Oxford, for Salisbury Cathedral, Holy Trinity, Cathedral in Birmingham, and at Easthampstead, all in England, as well as the window at Biarritz in France. Besides their cathedral windows based on biblical themes, they created some stained glass on romantic and literary themes for domestic use.

In the field of modern stained glass we find the artists concerned with abstractions in color and bold decorative patterns highly effective in carrying power rather than the traditional pictorial realism. Some of the modern stained glass windows are religious, others secular, but most are expressionist in interpretation. Three Germans, Gottfried Heinersdorff, Jan Thorn-Prikker, and Karl Schmidt-Rottluff, have experimented widely with religious symbolism and abstract studies in color and light, and have advanced particularly far the use of modern stained glass. Among other pioneers in the field is Fröydis Haavardsholm of Norway whose feeling for plastic treatment and structurally monumental composition has resulted in a powerfully expressive art; also, James Hogan of England whose recent designs include windows for Liverpool Cathedral and Temple Emanuel and St. Thomas Church in New York City.

The big problem in modern stained glass is not the handling of design, color or manufacture but rather that of a wider usage. Its potentialities as a contemporary art for use in home, commercial and public buildings are almost unlimited but to date stained glass is still more or less confined to church windows. See *Encyclopedia Brittannica,* 1942, vol. 21, pp. 291-297; Heaton, Maurice, "Progressive Steps in the Making of Stained Glass Windows," *American Architect,* Jan. 2, 1929, pp. 97-103; "Stained Glass: The Living Tradition of Religious Art," *Studio,* April, 1936, pp. 190-193; Teague, Walter Dorwin, "The Future of Stained Glass," *Architectural Forum,* August, 1940, pp. 99-100; Walker, N. W. Gregory, "How Stained Glass is Made," *Discovery,* April 1939, pp. 163-169. —N.P.

**stämning.** See SCANDINAVIAN ART.

**stamp.** *Book.* Strictly applicable to most binders' tools, but used in a restricted sense for a metal block having a complete ornament, coat of arms, name, etc.

**stamping tube.** See MUSICAL INSTRUMENTS.

**standard pitch.** See ACOUSTICS.

**stand oil.** This term comes from the German word, *Standöle,* and is used for a thickened oil. Traditionally it was thickened merely by standing or by being placed in the sun in shallow vessels. It appears to have been much used in the European oil painting of the 15th to 18th cents. —G.L.S.

**Stanislaus Augustus style.** See POLISH ART.

**starch.** In the arts this is used for an adhesive made from flour and so takes a secondary place in the construction. Pastes are made from the starch of rice, wheat, corn, potatoes, or arrowroot. —G.L.S.

**state.** See PRINTS AND PRINT PROCESSES.

**state planning.** See CIVIC PLANNING.

**state umbrella.** See SYMBOLISM IN FAR EASTERN ART.

**static.** The adjective static comes from the Greek root *sta. "stand." Statikos* means "causing to stand". It pertains to bodies or

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

forces at rest or in equilibrium. Aside from its mechanical application in architecture, it means figuratively resting, not active and denotes the reduction of all moving and changing forms to steadfast, unchangeable and unequivocal forms or combinations of forms. This figuratively static effect is accomplished in art if all parts of a whole are shown as resting elements in perfect equilibrium. In order to effect this static impression the single parts must be clearly outlined and easy to grasp, as e.g., in the Greek, Roman, or Italian architecture. It is interesting to notice how the Italian architects separated the clock-tower (campanile) from the main building in order to remain within the limits of this static effect. In painting and decorative art of a static character all parts are more or less arranged around a central point, so that the mutual center of gravity lies in the middle of the work. In the case of an oblong shape all parts are ordered about the two centers of gravity of an ellipse, as for instance in the Greek sculpture and in many Renaissance paintings. It is highly interesting to notice how the Greeks transformed agitated and therefore dynamic scenes like duels, battles, etc., into such of static characteristics.

The people who had the natural feeling for static expression were the Greeks and, in fact, the whole Greco-Roman family, in contrast to the northern Celto-Germanic cultural family, which preferred dynamic expression.

—A.J.S.

**station point.** See PERSPECTIVE.

**staurotheke** (Gr. from *stauros theke*). A container for a part of the Holy Cross. A reliquary used for this purpose. Since the story of the finding of the Holy Cross is connected with Constantine the Great's mother, the most famous reliquaries of this type originated in the Byzantine Empire. An ancient Byzantine reliquary of this kind is in the treasure of the cathedral of Limburg an der Lahn, Germany. For illustration see Willy Burger, *Abendländische Schmelzarbeiten,* Berlin, 1930, Figs. 11 and 12.

—L.L.

**St. Cloud ware.** See CERAMICS II.

**steel facing.** *Etch.* To prevent an intaglio metal plate from wearing out in printing a large edition, it can be chromium steel faced by electroplating. Delicate plates, esp. drypoints, are protected in this way also. See PRINTS AND PRINT PROCESSES.

**stele.** A stone pillar, used as a gravestone or to mark a site. The earliest known stele decorated with sculpture is a Summerian one dating from 2550 B.C., representing the king leading his army to defend his country; another pictures King Urnammu pouring a libation to a god. Buddhist votive stelai in China show the Buddha seated in the center with reliefs of figures, including the donors, sculptured above. Mayan stelai have also been found, decorated with religious scenes. The most beautiful stelai, however, are those made in Athens during the 5th and 4th cents. B.C. to serve as tombstones. The earliest ones were high and narrow, with usually a single figure, but by the middle of the 5th cent. the slab was made wider, allowing for more elaborate relief. Scenes pictured were usually a characteristic episode from the life of the deceased (a knight dealing the death blow to his foe, a lad with a pet animal, a woman looking at her jewels) or the final farewell in the home. These slabs were often crowned with a pediment and framed by engaged pillars at the side, the whole being impressive alike for the poignancy of the representation and the gracious simplicity of the design. In the 4th cent. the compositions became more crowded and the relief more coarsely cut. After the decree of Demetrios of Phaleron against the display of wealth, the market in Athens for such sculpture ceased, but similar grave reliefs continued to be popular in Italiot Greece.

—W.R.A.

**stencil.** This is a mechanical means of applying patterns with paint. The stencil itself is cut out of metal, thin cardboard, or other firm material in such a way that paint can be put into the areas left open. —G.L.S.

**stenochoreography.** See notation, dance.

**step pattern.** A decorative pattern in which lines are arranged like a section through steps, i.e., short lines alternately vertical and horizontal are set at right angles to each other and each horizontal projects in front of the last. —L.T.S.

**stereobate.** A masonry foundation or basement as seen above the ground level.

**stereochromy.** Known also as water-glass painting, this is a method characterized largely by the medium used. Water-glass is a mineral, a thick, syrupy, clear liquid, an aqueous solution of potassium or sodium silicate. With this pigments are ground or, in some in-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

stances, a thin water-glass is used as a fixative with pigments that have been applied with water alone. It has been much advocated for mural painting. —G.L.S.

**St. Gallen, school of.** See Carolingian art.

**Stiegelware.** See GLASS AND GLASS-MAKING.

**stile.** One of the vertical side-pieces in the frame of a door, sash, or panel.

**still life.** A picture of inanimate objects.

**stilt block.** See pulvin.

**stilted arch.** An arch, the springing of which is above its apparent impost; also **stilted vault.**

**stilts.** *Cer.* Fired clay supports to avoid sticking during firing. See CERAMICS I.

**simulation artistic.** See inspiration.

**stipes.** See altar.

**stipple.** To engrave by means of dots rather than by lines. See PRINTS AND PRINT PROCESSES.

**St. John's dance.** See St. Vitus dance.

**stock characters.** See THEATRE.

**stone.** Highly honored as a building material from ancient times, stone early became the substance of sculptured designs and, to a slight extent, became also a support for painting. Broadly, the kinds of stone can be defined as sedimentary, igneous, and metamorphic. The more familiar sedimentary rocks are slate, shale, sandstone, limestone, and gypsum. Igneous or primary rocks formed by solidification of molten masses from the within the earth include granite, feldspar, quartz, diorite, and basalt. Metamorphic rocks are either sedimentary or igneous in origin but have been slightly changed in character by movement of the earth's crust or by chemical action. Marble is a metamorphic condition of sedimentary limestone and chalk. —G.L.S.

**stone carving.** See CHINESE ARTS.

**stone-close.** Term applied to a circular doorway or opening in a wall. The term is derived from the practice of closing such an opening with a stone slab shaped to fit and held in place with props. —J.M.M.

**Stonehenge.** See PREHISTORIC ART.

**stone pipe.** See Eastern North American aboriginal art.

**stop.** Name for the draw-stops, or stop-knobs, of an organ.

**stopping out.** *Etch.* The act of stopping certain sections of a plate from further exposure to the acid bath; also protecting the back of the plate from etching. Quick-drying stopping out varnishes are used for this purpose. See PRINTS AND PRINT PROCESSES. —K.K.

**storage forms.** See FURNITURE.

**Storm and Stress.** See GERMAN ART.

**story.** In architecture: The space between two floors.

**straight drama.** See RADIO DRAMA.

**straw, artificial.** A rayon specialty yarn where viscose spinning solution is forced through an "L" shaped spinnerette instead of the round hole. The viscose process is used only for this yarn in America. The yarn consists of the continuous, flat and heavy filament, which is folded during spinning. It resembles a silk-like straw and has a lustrous or dull crinkled surface. It is quite flexible and made in 100 and 150 denier sizes in America. —G.W.R.

**Strasbourg turpentine.** See oleoresin.

**streamlined.** Originally expression for forms which were shaped in order to overcome the pressure of air or water currents, e.g., piers of bridges, bows of ships, locomotives, automobiles, airplanes. The streamline originates as result of aero-dynamic calculations. Applied to these objects it represents the true expression of their function.

During the last decade the word often has been applied and misused for any so-called modernistic forms. From architectural façades to ladies' hats and flashlights, everything became "streamlined". Virtually, that did not mean anything else than the renunciation of superfluous ornamentation. Paradoxically, even so-called modernistic architecture, supposed to be functional, became streamlined by applying the forms of swift moving objects to balconies, corner windows, roofs, etc., as if these architectural details were exposed to terrific aerial pressure. Actually, these forms were entirely unfunctional since they were not born of practical needs or technical suppositions but merely patterned by a slogan-like fashion. Leading pioneering

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

architects of our days did not succumb to this temptation. See functional architecture; international architecture; traffic, aesthetics of.
—P.Z.

**street music.** Presupposes an urban environment and consists, in its most characteristic form, of the cries of venders of various types of merchandise. To these we must add the music of ballad singers, of performers on the hurdy-gurdy, and on other instruments, who seek to induce passers-by to part with coins of small value. It is a very ancient practice, but one which has fallen into disuse in modern industrial communities where the most leather-lunged vender might call in vain without being heard against competing mechanical noises of all kinds.

A French poem of the 13th cent., the *Crieries de Paris,* represents the poet as the victim of his own lack of sales resistance, having spent his substance on the innumerable venders who swarmed the streets of old Paris: the *étuviste* who called in the streets when the water in the baths was warm, the *mercier* selling pins, needles, and even *bons flageus a pastor* (good shepherd's pipes), sellers of brooms, sausages, herrings, cheese, birds, and Noës.

In this and other works of the period we are simply informed about the various kinds of street venders. In the *Cris de Paris* of Jannequin we possess the actual music of a number of these songs woven into the polyphonic texture of a French chanson. After the four voices harmoniously invite the listener to hear the cries of Paris, we hear the soprano sing of "little warm pastries", the alto "claret wine for ten deniers", and the tenor "fried tarts", while the bass finally joins in with fine, hot "cache-museaux", the whole ensemble painting a vivid and witty genre picture.

A ballad of the period of the French Revolution draws its rather grim humor from the fact that the hero, "le franc Picard", interprets the calls of the street venders whom he hears according to his fears. Thus the oyster woman sings to a pretty air, "Oysters on the half shell" (*Huître à l'écaille*), but the uneasy Picard imagines he hears, "There is the rascal" (*v'la la canaille*), and runs off as fast as his legs will carry him.

Perhaps no more detailed account of the street cry has been published than *Les Voix de Paris* by Jean Georges Kastner who flourished in the mid-19th cent. (1857). He not only reproduces a multitude of cries, some of them (like those of the newsboys) having a strangely modern flavor, but anticipates a scene in Charpentier's *Louise* by writing a sort of cantata in which various characters indulge in reveries to a musical background suggesting in poetic fashion the street noises appropriate to the time of day. Thus the first episode, *"Paris le matin"*, introduces the Sleeper (*Le Dormeur*) who clings to his slumbers till finally roused by the cries of the street peddlers outside. Of later date and much more familiar is the opening scene of the second act of Charpentier's *Louise* where the awakening of Paris is musically portrayed by the voices of workers and itinerant venders. Thus we see the persistence and vitality of a trait which spans six centuries.

In Italy music tended in general to be courtly almost to the exclusion of popular elements which, when they do appear (as in the *frottola*), seem frequently to be treated as parodies rather than in a serious mood. Nevertheless, traces of the popular street cries can be pointed out, such as the call of the fish peddler who praises his crayfish in a *caccia* by Landino. The *Pazzia Senile* of Adriano Banchieri belongs to the 17th cent. It represents a series of scenes derived from the traditions of the *commedia dell'arte* (q.v.) which are interrupted by intermezzi, one in the guise of the song of the rag and bone men, another sung by match peddlers, the finale in the form of a peasant dance. Even Domenico Scarlatti, if we can credit the music historian Burney, employed popular motives and the songs of muleteers in his elegant and vivacious lessons for harpsichord.

The German tradition, at least as far back as the 15th cent., includes elements which are hearty, popular, robust, so that it seems quite natural to find references to street cries in German musical compositions. The *Jahrmarktsgauner* of Sebastian Knüpffer portrays such types as the rat-catcher and the scissors-grinder. The music composed for the latter suggests the continual turning of the grindstone by a persistent *ostinato* in the bass. A *quod libet* of 1622 by Friderici is constructed on the street cries of Rostock, divided (like the more recent work by Kastner) into sections depicting morning, midday, and evening. This work begins with the call of the night watchman followed by milkmaids, cabbage venders, broom-makers, cobblers, and the quack doctor, each with appropriate music. All then join in a New Year's song. The watchman blows his horn as a warning that the town gates are about to close, and an

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

agitated *sinfonia* suggests the rush of the market folk to get out of town before the gates close. A song of rejoicing closes the work. Finally, Johann Caspar Horn has painted a similar genre picture in his *Zum Jahrmarckt* with its broad and festive opening. His list of characters is again drawn from familiar folk types, the town crier, the rat catcher, while part two introduces the scissors-grinder and the tooth-puller. Enough has perhaps been said to show the strong popular element in this music and the part which street merchants and their cries play in such works. Bach's *Peasant Cantata* is in this same style though here we find no use of street cries. The sentimental and emotional nature of much German romantic music was not favorable to the use of folk cries though the figure of the night watchman reappears later in Wagner's *Mastersingers* intoning his reassuring "All's well".

In France the earliest use of the street cry is in the chanson. In Germany the favorite medium is the cantata. In England, however, composers employed a special form which was derived from the fancy. In these compositions the cries of the London streets are counterpointed against a polyphonic background played on the viols. Among the composers who cultivated this form were Orlando Gibbons and Richard Deering. The vogue for Italian music during the 18th cent. formed an unfavorable background for folk music though we find traces of the cries of street merchants here and there, as in a popular song published in the *Musical Miscellany* in which the singer calls on the maids to bring out their coney skins.

At the present day street music survives with difficulty in the industrial west, overcome by the competing mechanical noises and the restless motion of the great city streets. The street singer has not altogether passed from our streets, and the German band and the Italian organ grinder with his monkey are at least recent memories. The junk man in his horse-drawn wagon attracts attention by a string of jangling bells, or intones his hoarse cry. On London streets before World War II the Welsh miners sang, and in Paris an itinerant herd of goats was escorted by a goat-herd whose shrill piping announced his presence. These, however, are survivals of a very ancient past, doomed to extinction except perhaps in the East, in corners of our own South, wherever older ways of buying and selling still persist. However dubious a future street music may face it has left a firm imprint on the musical art of the past. It was Rameau who said in his *Code de musique pratique,* "Listen to the people who sing as they cry their goods in the street." —C.W.H.

**strength.** In literary criticism this term is used to indicate that a work is forthright, obvious, and definite in the statement and treatment of its material, the quality of *strength,* usually contrasted with *subtlety* or *delicacy,* denotes that a work is positive and uncompromising both in the development of its subject-matter and in its formal structure. "Strong" art is held back by no doubts springing from a consciousness of complexities, but exhibits a complete assurance and conviction. —I.J.

**stress, in dance.** See movement.

**stretcher.** (1) This is an accessory to the canvas support of painted pictures. It is a frame of four or more pieces over which the canvas is fixed, usually by tacks. As a rule, stretchers are provided with keys or small wedges so set that they can slightly enlarge the frame and tighten the canvas if it gets slack. —G.L.S.

(2) In masonry: A stone laid with its longer face in the surface of the wall.

**stretto.** (1) Coda or finale in quicker time than the rest of the piece. (2) The part of a fugue (q.v.) where subject and answer overlap.

**strigil.** See Apoxyomenos.

**string.** See ACOUSTICS.

**string course.** In masonry: A horizontal band of stone sometimes specially shaped and projecting, often carried at a given level to accentuate the horizontal divisions of a structure. —J.M.M.

**string quartet, quintet, trio.** See chamber music.

**Stroganov school.** See RUSSIA, RELIGIOUS PAINTING IN.

**strontium yellow.** This is related to barium yellow, being a strontium chromate instead of a barium chromate. Like the barium pigment it has a lemon hue but is a little deeper in tint and has a somewhat greater hiding power. —G.L.S.

**strophic song.** See song.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**structure.** *Mus.* Term designating the formal properties of a composition; almost a synonym of *form, structure* is used instead of *form* esp. if constructive factors are focussed. —E.K.

**Stuart period.** The reign of the house of Stuart in England began with the accession of James I in 1603, was interrupted by the artistically sterile Commonwealth from 1649 to 1660, and ended with the death of Queen Anne in 1714. It began with the supremacy of a heavy baroque style imported from Flanders and Germany, but soon accepted an academic compromise inspired by Palladio and the Italians. It produced a number of native designers now famous in English architectural history, Inigo Jones, Sir Christopher Wren, and Sir John Vanbrugh, and their equally noted creations, respectively the Banqueting Hall of Whitehall Palace, St. Paul's Cathedral, and Blenheim Palace. See ENGLISH ART. —P.C.B.

**stucco.** Evidently this word has been adapted to a style or type of thing rather than to a particular material. It is ordinarily applied to reliefs and similar decorations on buildings. These may be made of gypsum, of pozzalanic cement, or of lime plaster. —G.L.S.

**studio.** (1) The workroom of an artist; (2) a classroom in which art work is carried on. Syn. *art room.* Whitford and Winslow in *Dictionary of Education.*

**studio easel.** See easel.

**stuffers.** Sometimes called "fillers" are extra threads laid lengthwise and crosswise of a carpet and which do not add strength, but simply increase the bulk, weight and stiffness. —B.E.J.

**stump.** A small instrument used by a draftsman, this is rolled up from chamois skin or paper and serves for smoothing out the tones of crayon or charcoal drawings. A still smaller tool of the same sort, pointed at only one end, is called a **tortillon.** —G.L.S.

**stupa.** The stupa or **tope** was originally a tumulus for the interment of royalty in early India. Later, such mounds were used for the interment of the relics of the Buddha and His sainted followers. By this function, the stupa, divinely animated by the quickening presence of the relics of the Tathâgata, came to be a special kind of Buddhist shrine. The principal elements of the stupa consist of one or more square or round bases surmounted by a hemispherical cupola or ***aṇḍa.*** This domical member is a solid mass of brick and earth. Above the ***aṇḍa*** is a balcony-like member or ***harmikā,*** and, surmounting all, a mast or ***yasti,*** upon which are ranged numbers of ceremonial umbrellas or ***chattas.*** At some time in the course of its development, a cosmological or metaphysical interpretation was assigned to the stupa and each of its elements. Thus, the base represented the earth, the cupola the enclosing dome of the sky, and the *yasti* represented the world-axis with the tiered parasols typifying the successive *devaḷokas* rising above the world of men. The *harmikā* symbolized the Tuṣita Heaven set on the summit of the cosmic Mt. Meru which we must imagine as enclosed in the dome of the monument. The whole could therefore be regarded as a reconstruction of the Indian concept of the cosmic scheme. The stupa is at once a symbol of the Buddha's *Nirvāna*; it is an architectural body for Him who had disappeared into the realm of invisibility; and, by derivation from its cosmic symbolism, a likeness of the Buddha as the Universe itself. Its former employment for royal burials was assimilated to the concept of the Buddha as ***cakravartin*** or world ruler.

In Ceylon the stupas or ***dagabas*** are believed to typify in hieratic fashion in their architectural form the successive stages of magical power attained by Buddha at the time of His Enlightenment.

In later stupas of Mahāyāna Buddhism the corporeal relics were replaced by written spells or ***dhāraṇī.*** The insertion of these magic writings was believed to be no less effective in endowing the monument with divine vitality in a form of Buddhism which regarded the Buddha's earthly appearance and *Nirvāṇa* as a mere illusion. The typical Indian stupa may be illustrated by the famous monument at Sāñchī and numerous examples in Gandhāra (Northwest-Frontier-Province). In Tibet and Nepal, the chief centers of esoteric Buddhism, a special type of stupa was developed in which the four mystic Buddhas of the Four Directions were represented by statues on the base, and the all-seeing eyes of the self-created primordial Adi Buddha were painted on the ***harmikā.***

The final development of the stupa form is to be seen in the great monument of Barabudur in Java, in which the hemispherical profile of the structure literally encloses the terraces of the pyramidal world-mountain

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Meru. Barabudur is really a *maṇḍala* in stone, and its symbolism goes far beyond that of the original stupa.

It is definitely known that elaborate geomantic ceremonies determined the orientation of the stupa, and the most precise system of proportions fixed the measurement of the whole and its every member. It is for this reason that the stupas have something of the same mathematical perfection of sheer architectural form and mass that we find in the Pyramids. The architectural effectiveness of the stupa depends on the alternation and balance of round and square shapes. The completely undynamic and static character of stupa architecture is thoroughly expressive of its function of enclosing and guarding the relic and its symbolism of the fixed cosmic structure. —B.R.

**Sturm und Drang.** See GERMAN ART.

**St. Vitus dance or St. John's dance** (according to the patron saint who was supposed to protect the afflicted). The dancing malady that swept over Europe during and immediately after the Black Death (14th cent.). Its appearance is thought to be due to a nervous disorder akin to imitative hysteria. The depleted physical and tortured mental conditions of the wretched populace, caused by war, pestilence and famine, played a large part in conditioning their minds for the mental disorder that found relief in this demoniacal dancing epidemic. Men, women, and young boys and girls would dance in wild delirium, seemingly possessed and without any will of their own. Morbid bystanders often became infatuated and would join in the bacchanalian frenzy. In Italy the same disorder was called *tarantism,* as it was at first thought to be caused by the bite of a tarantula. It was discovered, however, that even those who were not bitten contracted the disease, and the only explanation pointed to a mental disorder. (H'Doubler, M. N., *Dance, A Creative Art Experience,* F. S. Crofts & Co., 1940.)

**style** (from the Gr. *stylos*; L. *stilus*). (1) A stilus was a metal writing instrument which was used to engrave letters upon small tablets covered with wax, comparable with our modern pen. In the same way that we in our time have transferred the meaning of the word pen to that which is expressed, saying he has a fluent pen, the writing instrument stilus became an expression of the manner of writing. From this the meaning became more inclusive and was transferred to the whole field of art.

Starting with this figurative sense, style means those characteristics of form which are peculiar to a certain work or a group of works, and which at the same time distinguish it or them from other works. These characteristic peculiarities must be organic, and thus are recognized as the signs of an expression of a complete unit. Take for example a work in the Gothic style. The single and separate characteristics, such as the pointed arch, the crossed vault, the aspiring pillars, etc., do not make the Gothic style, but it is the organic relationship of all these parts which forms a significant whole.

As one applies this word to the works of a single artist, so the word is applied to the works of a whole school when we speak of the style of a certain school: the style of the School of Leonardo, of Cranach, or of Rembrandt, for instance. An entire group of artists can be bound by such peculiarities of style without necessarily having a leader, as for instance the Bohemian school, the Danubian school, or the Fontainebleau school. We can continue and apply the word to whole epochs characterized by a certain coherence of style. So we speak of the Roman, Gothic, baroque styles, etc. Besides these styles of epochs, whole groups of peoples or races are distinguished by certain peculiarities of expression or style. So the style of Egyptian art is in clear contrast to that of the Greek people. In recent times research has been done on the difference of style between the northern (Germanic) and the southern (Latin) peoples. (See O. Hagen, *Deutsches Sehen.*) Principles of development have also been found within the changing style of an epoch. (See Woelfflin, *Formprobleme der Kunst.*)

Of decisive importance to the discussions of style and on the causes originating that which we call style was Gottfried Semper's work, *Der Stil.* Semper argued that the peculiarities of style in art are caused mainly by the peculiarities of the material which must be worked with: clay, metal, wood, wool, silk, etc. All materials require to be worked according to their natural characteristics. Clay, for instance, must be modelled which makes its forms appear different from those of metal which must be melted, or from those of wood which must be carved. A wool fibre demands a different treatment even in its coloring from a silk fibre, because the structure of each is very different. To these

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

material peculiarities there must be added the purpose for which the material serves: Receptacles, for instance, result in the different shapes of a casket, a barrel, a bottle, etc., according to their various uses. On the basis of the peculiarities of material and purpose, that which we call style necessarily depends. The followers of Semper's theory are numerous even today.

This theory was opposed by Aloys Riegl who in his several works, esp. in his *Spätrömische Kunst-Industrie,* took the position that style originates in a subjective will-to-art lying in the human being himself. The spiritual structure of the will of man and the artist seeks an expression which is in accordance with the individual peculiarities of his own will. With every material there are several possibilities of handling, and the solutions of the purpose may be varied. One can and should choose that manner which is in accordance with these alternatives. One is reminded of the different techniques of handling stone used by the artists of the Egyptian and the Gothic epochs. Only by means of Riegl's theory is it all possible to explain the historical development of a style as it may be observed, for instance from antique times up to the Christian era. Riegl decisively opposes the so-called "Verfalls Theorie". Each period has its own style arising from its spiritual depth of will. Different styles, of course, may be compared by an analysis of the content, but the value of a style is a thing which cannot be compared with any other value. The followers of this theory were mainly historians of modern art (art from medieval times until today). Woelfflin and his circle applied Riegl's rules to special departments of art.

A compromise between these two theories had already been found in 350 B.C. by the Chinese people. In his parable of the carver of the stand for chimes, Dsuang Dsi said that the natures of the material and the man must be united before a real work of art can be created. The parable concludes with the words: "When the right tree stood before my eyes then the stand for the chimes stood finished before me, so that I had only to put my hand to it. If I had not found that tree I should have given up. Because I allowed my nature to conform to the nature of this tree, men consider it a divine work." (Dsuang Dsi, *The Right Book of the Southern Land of Blossoms,* trans. and comments by Richard Wilhelm, Jena, 1920.) —A.J.S.

(2) *Dance.* Style is the by-product of the particular way in which the dancer selects, organizes, and manipulates all the contributing elements of his materials, physical and psychical, into a harmonious entity. In this sense every dance that is an organic solution of its problem has a style of its own, while at the same time it may erect characteristics that belong to the *style* of the creator and performer.

In the *style of* refers to a manner of performance distinctive or characteristic of an era or of another dancer. —M.N. H'D.

(3) *Mus.* Set of idiosyncrasies characteristic of certain types of compositions (e.g., symphonic style, a cappella style); of a period (16th cent. style, baroque style); of a composer (Palestrina style, Wagner style); of a period in the life of a composer as distinguished from other periods (late Beethoven style, early Schönberg style); of a manner of interpretation (virtuoso style). Sometimes used in the sense of idiom (modal style, atonal style), the terms covers actually less than idiom (q.v.). —E.K.

**style flamboyante.** See Gothic.

**style mécanique.** See FRENCH ART.

**stylize, stylization, in dance.** To *stylize* movement is to emphasize the essential phase of a movement to heighten the awareness of certain qualities. This is accomplished by checking the movement at the one point that is most suggestive of the intended meaning, as opposed to abandoning the movement to its full range of action. Stylization imparts a pictorial element of design to the body and its parts while in action, and if not sensitively and artistically employed such movements easily become manneristic and statically patterned. The result, under these conditions, is that the body is used more as a decorative unit than as a plastic expressive instrument. Stylization is artistic individual distortion. —M.N. H'D.

**stylobate.** Uppermost part of a stereobate (q.v.) or top step before a temple, on which is supported a row of columns.

**stylotint.** An aquatint process that resembles a dry brush drawing or a monochrome Japanese water color. Whole passages can be controlled by the stopping out. —K.K.

**stylotint (an intaglio process).** Stylotint is an unexplored medium which is capable of great freedom, variation, character and sen-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sitiveness, and a great variety of curious textures, and when it is combined with tones of aquatint it can produce results similar to a Japanese monochrome water color.

Stylotint is a method of etching in which the coating on the plate is soft and easily displaced with a stick, stump, stiff brush, rag, or steel point. If the stylus, of wood or any other material, is cut like a chisel on the end it will produce a line of variable thickness. This is the type of line which most resembles the Japanese brushline.

The parts of the plate from which the coating has been removed in this way will appear black in the finished proof. After the drawing has been made, the plate is heated and the ground becomes stronger than a regular hard ground.

This process belongs to the family which includes pen process aquatint, offset soft ground, as well as stylotint. Although each one of these processes uses a different way of producing areas of open copper on an otherwise coated plate, they all break up the open surfaces with aquatint so that they print as areas of aquatint in the shape of pen or brush lines, crayon lines, or wooden stylus lines.

The beauty of this process, invented by Alexander von Kubinyi of Munich, lies in the quality of the lines and textures, the ease with which large areas of black are produced, and in the smooth, easy resistance of the drawing tool on the surface of the copper. The interplay of the first and the last of these qualities, the way a sharpened wood stylus acts on the smooth copper plate covered with a soft ground, makes possible a control, a type of line, a kind of drawing not obtainable in any other way. —K.K.

**stylus.** In the history of art a metal point used for faint marking probably has had a wide and variable use since metals were discovered. Such a point was a common writing instrument in ancient times. It marked preparatory lines on pottery and on walls where paintings were to be executed. In some cases it indicated the lines for writing in manuscripts. It turned the circles of haloes and punched the holes in paper cartoons through which drawings were pounced or transferred to another surface. —G.L.S.

**subtractive color mixing.** See COLOR.

**suggestion** (L. *suggestio*). Calling to mind through the association of experiences, images, or ideas, or having the power to do so under specified conditions. One of the two modes by which works of art are transmitted to the mind of the observer or appreciator; the other being *presentation* (q.v.). Suggestions may be conveyed through arbitrary symbolism, based on conventional bonds of cultural usage; through imitation and resemblance, as in a realistic picture or statue; and through common association, as between smiling and happiness. The suggestive power of an image operates only through the previous conditioning of an individual; but similar conditioning among individuals makes possible similar apprehension of meanings, as when members of a cultural group read a poem produced therein. Suggestion and presentation operate as factors in a work of art, when part of its effect is produced by direct sense-perception, part by associated meanings. —T.M.

**sui** (Ch.). Jade girdle-clasp.

**Sui art.** See CHINESE ARTS.

**suiboku-e** (Jap.). Black and white painting. *Sumi*, or ink, is used as the sole medium.

**suiboku-ga** (Jap.). See suiboku-e.

**suibokugwa** (Jap.). See JAPANESE ART.

**Suiko art.** See JAPANESE ART.

**suisaiga** (Jap.). Term for water color painting.

**suite.** *Mus.* A set, cycle, or series of pieces. The suite was the predecessor of the sonata (q.v.) and the symphony (q.v.). It was a succession of dance compositions, frequently introduced by a prelude. The chief dance forms employed were the allemande, courante, sarabande, gigue, gavotte, bourrée, minuet, passepied (qq.v.).

**super-piano.** See electrical instruments.

**superrealism.** See surrealism.

**superstructure.** Any structure or any part of a structure, built upon or considered in relation to the part on which it rests; a building considered in relation to its foundation. —J.M.M.

**supertonic.** See idiom B (1).

**support.** There has been some difference in terminology about the underlying material on which pictures are made. Frequently it has been called the ground but that word has now come to mean, almost without exception, the uniform coating or preparation which lies next underneath the paint itself. A more recent tendency has been to give the word, support, to any of these materials and it has been defined as 'the physical structure which holds or carries the ground or paint film.' —G.L.S.

**supporters.** See HERALDRY.

**suprematism.** An abstract movement in painting founded in Moscow in 1913 by Kasimir Malevich, famous painter of the picture *White on White* (1919). Includes Alexander Rodchenko, painter of *Black on Black* (1919). Flourished during World War I and into the 1920's. Malevich defined the doctrine in the following sentence: "By Suprematism I mean the supremacy of pure feeling or perception in the pictorial arts—the experience of non-objectivity". See RUSSIAN ART. —L.D.L.

**sug.** (Ar.). A bazaar. See ISLAMIC ART.

**surface color.** See COLOR.

**surface film.** This has a general definition of any outer coating material which may be used on a picture, on a piece of sculpture or on any work of art. It can include oils, varnishes, waxes, and other substances which are capable of forming such a film. —G.L.S.

**suri-haku** (Jap.). A fabric with the decoration painted on in gold-leaf alone.

**surimono-e** (Jap.). A wood-block print used as a greeting-card.

**surrealism** (Fr. *Surréalisme;* Ger. *Surrealismus*). A 20th cent. movement in art which finds a "super-reality" in the objects of subconscious mental activity. It is sharply opposed both to naturalism (q.v.) and to purely abstract painting (q.v.)

André Breton issued in 1924 the first "Manifesto of Surrealism." Since that time the movement has had many followers among French and Spanish artists and has spread to many parts of the world. While surrealism has been manifested chiefly in painting and poetry, it has also appeared in drama, stage settings, photography, the motion picture, architecture, and commercial art.

As to its sources, the most immediate one seems to have been dadaism (q.v.), several of the most prominent surrealists, such as Hans Arp, Tristran Tzara, Marcel Duchamp, Man Ray, André Breton, and Max Ernst, having been allied with the dada movement. Surrealism shares with dadaism such features as the latter's irrationalism, its denial of the conventional values of civilization, and its repudiation of ethical, religious, and (at least conventional) aesthetic values. In many respects surrealism is closely related to expressionism (q.v.). Furthermore, many anticipations of surrealist motives and methods may be found in the romantic school, especially in the romantic poets, though this point may have been overemphasized by some exponents of surrealist theory, such as Read.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Fantastic art which has at least an external similarity to the work of the surrealists may be found throughout the entire history of European art. Abundant pictorial evidence is given in the earlier portion of *Fantastic Art, Dada, Surrealism,* listed below. Yet we must be cautious in attributing to such artists as Giuseppe Arcimboldo, Hieronymus Bosch, Giovanni di Paolo, Giovanni Battista Bracelli, or William Blake psychological motives identical with, or even closely similar to, those of twentieth century surrealists.

Surrealists assert that their work is based upon the dialectical materialism of Karl Marx and the psychoanalysis of Sigmund Freud. In their actual products, however, they are far less obviously dependent upon Marx than upon the Freudian theories. A relatively uncontrolled imagination reigns supreme. Subconsciousness is the well from which creative activity is considered to draw its inspiration. The dream is exalted above waking thought, pathological states above the normal. Surrealists feel a close affinity with primitive art and with the spontaneous, untutored art of the child. Symbolism, to a great extent sexual in character, is prominent. The ideal method of artistic activity is held to be automatism—letting the hand of the painter move freely without conscious control or letting the poet's pen record the free flow of images which spring up from the subconscious or unconscious. At the same time, the degree of formal organization achieved in many surrealist works would seem to indicate a greater measure of conscious or rational control than is sometimes conceded.

That surrealist painting is closely bound up with poetry is evidenced in various ways. In some surrealist writings, we find that such poets as Coleridge and Blake among the English, and Lautréamont and Rimbaud among the French, are looked upon as sources of inspiration. A number of representative surrealist painters are also to be numbered with the surrealist poets, for example, André Breton, Paul Éluard, Georges Hugnet, Tristran Tzara, Francis Picabia, Georgio di Chirico, Hans Arp, and Salvador Dali. Pablo Picasso, who has contributed to surrealism as well as to so many other modern movements, is a poet as well as a painter. Again, a number of surrealist painters—for example Breton, Hugnet, and Joan Miró—have incorporated poetry, in a literal sense, in certain of their paintings.

In addition to those mentioned above, some of the artists who have figured in the surrealist movement are Eileen Agar, John Banting, Hans Bellmer, Constantin Brancusi, Victor Brauner, Edward Burra, Oscar Dominguez, Leonor Fini, Alberto Giacometti, S. W. Hayter, Valentine Hugo, René Magritte, André Masson, Reuben Mednikoff, E. L. T. Mesens, Henry Moore, Paul Nash, Richard Oelze, Erik Olson, Meret Oppenheim, W. Paalen, Roland A. Penrose, and Yves Tanguy. Of course, the activity of some of these artists has not been confined to surrealism.

**syllabic chant.** See MEDIEVAL MUSIC.

**symbol notation.** See NOTATION.

**symbolism.** The purposeful or non-purposeful use of sensory intermediaries not as likenesses of objects otherwise accessible, but as means of establishing contact with objects so universal, so extended in space or time or so remote from our approach as to be partly or wholly, momentarily or always inaccessible to direct intuition. This definition, though suitable to cover all forms of artistic and religious symbolism, is not meant to cover also the symbolism of mathematics and of symbolic logic in which the term is used as equivalent to "substantial sign" and to "conventional sign". —R.B.

**SYMBOLISM IN FAR EASTERN ART.** Symbolism is all important in the arts of the Far East. What would pass in the West for an item of decoration is nearly always the picture or symbol of an idea, readily understood by the people of the culture which produced it. Consequently, without some knowledge of the meaning of the principal symbols, and of the traditions from which they rose, it is impossible for an Occidental fully to appreciate the productions of Far Eastern Art. It is not enough to enjoy symbols as mere design without knowing the reason for their presence.

This subject, at first glance discouragingly complex, becomes less so when one finds that the wealth of symbols in Eastern Asia can nearly all be traced to Chinese origins—except for the small but significant group which came from India with Buddhism. For Korea, Indo-China, and even Japan were, artistically-speaking, merely cultural provinces of China. Thus the student can restrict himself to the mastering of but one basic tradition. Furthermore, one soon finds that most of the symbols can be conveniently reduced to three general types. These are: (1) ancient Chinese symbols of religious or philosophic portent; (2) Buddhist and Taoist religious symbols; and (3) folk symbols intended to bring luck or repel demons, derived from popular beliefs. As will be seen, however, a given symbol might originally have belonged to the first or second category, only to lapse into the third at a later period.

Ancient Chinese symbolism is well represented on the sacrificial bronzes of the Shang and Chou dynasties to be seen in many of our museums. The principal motive on these vessels is a full-face monster mask, made up of prominent features from several animals, and often composed of two such faces in profile, forming a single mask. People of later ages called this face the **t'ao-t'ieh** or "glutton", because the conventional absence of the lower jaw gives the appearance of a wide-open mouth with vast swallowing capacities. However, the fearsome aspect of this mask, often shown looming half-formed through scroll patterns representing thunder clouds, suggests that the face was intended to represent a potent sky-god, who was to be propitiated by the offerings presented in the vessels on which it is figured. In later, less rigidly conventionalized representations the ogre is shown as either giving forth or devouring bird and plant forms. Thus it was probably either a sun god, with the power to give life and warmth, or to burn and sear; or else a storm god who—like the more recent dragon—could bring life-giving rains or cause devastating floods. In later times the *t'ao-t'ieh* mask was figured on armor, shields, temple friezes and incense burners, where its frightful expression was believed efficacious in scaring off evil spirits.

Also portrayed on the bronzes are more recognizable animal heads, frequently repeated, suggesting prayers for the fertility of flocks. While cicadas on burial objects, or carved in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

jade, symbolized the continuance of life after the death of the body. Bird forms were also popular, particularly owls, indicating that the latter had not yet come to be regarded as a creature of ill-omen, though it has been shunned as such by Chinese artists of later ages. The identity of most of these early symbols can only be conjectured, however, because with the burning of the books in 213 B.C. all exact knowledge of the tradition that produced them was swept away.

With the Han Dynasty (206 B.C.-204 A.D.) China emerged as a unified empire, and in the arts stimulated by unity and relative peace, more profound philosophical and religious concepts made their appearance. These were particularly expressed in diagrams of the universe in microcosm, which have been constantly repeated in Asiatic art, with but slight variations, until modern times.

The most abstract of these diagrams was a circle bisected by a wavy line, one half being red, the other black. The red section represents **Yang**, the male element in the universe, source of life, light, and heat, while the black, or colorless, section represents **Yin**, the female element, to which is ascribed darkness, cold, and death. The complete symbol, containing both, is known as the **t'ai-chi** or great Absolute. Around the *t'ai-chi* are usually grouped the eight trigrams (**pa-kua**) which since antiquity have served as the basis for Chinese divination. These trigrams are made up of straight, long and broken lines, each pair of which represents two of the chief contrasting phenomena which were believed to have been created by the interaction of the Yin and the Yang at the time of the origin of matter, the principal ones being Heaven (pure Yang) and Earth (pure Yin). Around these are often grouped the twelve animals of the zodiac, a group of creatures arbitrarily chosen to represent the months of the year, and the years in the Chinese cycle,—thus adding the element of Time to the basic pattern of Matter and Space. In all diagrams of the above type, however, the *t'ai-chi* is considered to be the main element, to which the other symbols are merely accessory. As will be seen below, the philosophical dualism expressed by the Yang and Yin still underlies all Chinese thought, and has had a profound effect on Chinese symbolism.

A more concrete representation of the cosmos, which first appeared in the art of the Han period, was the portrayal of the axis of the universe as a mountain (like *Sumeru* of the Hindus), standing in the midst of the waters, with sky dragons among the clouds above. This persisted through the centuries until in the last two dynasties (Ming and Ch'ing) it was eventually incorporated in the pattern on the imperial robes, to symbolize the fact that the Emperor, as the Son of Heaven, was vested in the universe.

Also popular was a flat plan of the world order, often shown on the backs of Han mirrors. In this, the circular, central boss on a square field represents the dome of Heaven above the square of Earth (q.v. stupa). On each side of the square was one of the animals of the four directions. These animals (the **black tortoise** of the North, the **azure dragon** of the East, the **red bird** of the South, and the **white tiger** of the West) have occupied a prominent place in Chinese art ever since. Particularly popular have been **the dragon** and the **tiger**, which were chosen as symbols of contrasting ideas, as well as of opposite directions. For as concrete representatives of Yang and Yin—the dragon as a celestial creature, and the tiger as a terestial—they represent the contrast between spiritual and material. One must remember, though, that symbols may change their meaning entirely in different contexts. Thus the tiger, which was probably originally chosen to signify the Yin because of its soft step and reputed guile, may be considered equally effective as a Yang symbol because of its great strength and energy, and in fact it has often been used by itself as a symbol of Yang.

The beneficial, rain-bearing dragon, apart from its other symbolic uses, has long been the symbol of China itself, and of the Emperor who was thought to confer grace to his people by acting as the Regent of Heaven. As a result the perfect, five-clawed dragon (**lung**) was reserved for the Emperor alone, the only exception being its use on religious objects. Similarly, the less perfect, four-clawed dragon (**mang**) was reserved for the sons and immediate relatives of the Emperor, until with the decline of tradition in the last dynasty its use was conferred on the highest officials as well. Popular art, denied the use of these, was forced to content itself with a sort of dragon-snake. (Dragons in Japanese art commonly have but three claws.)

Just as the dragon represented the Emperor, and was figured on his possessions, the robes and belongings of the Empress displayed a magnificent mythical bird, composed of the most resplendent characteristics of several natural birds such as the peacock and argus

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pheasant. (Although Western writers have generally described this as a "phoenix", it seems wiser to retain the Chinese name **fêng-huang**, since it bears no resemblance whatever to the phoenix of Occidental folklore.) Princesses living at court were allowed to have robes and hangings showing slightly less elaborate species of the same bird, under different names; but except for use in temples or on wedding gear (since the bride was figuratively queen for a day), this too was forbidden in popular art.

Among the other mythical creatures which abound in Chinese folklore, the one most frequently shown in art is probably the **ch'i-lin.** (Western writers often wrongly describe it as a unicorn, though it has two horns, and differs in every other respect from the unicorn of medieval European bestiaries, having the body of an antelope, covered with scales, a dragon-like head, and a bushy tail.) Since before the time of Confucius this creature has been considered as having vast wisdom, and being a thing of good omen. In addition, because of an allusion to it in an ancient poem, it has long been considered a symbol capable of granting an illustrious posterity.

Also to be listed among the mythological animals is the **lion** of Chinese art, a strange curly-haired creature, usually white with a blue mane, devised by artists who had never seen the living animal. It is generally a symbol of bravery, or of the power of Buddha's law. This in turn seems to have been the inspiration for still stranger creatures, such as the **horned lions**, called ***hsieh-chai*** and ***pai-tsê***, which in imperial days symbolized the lesser nobles and the court censors.

The **crane** and **tortoise**, because of their reputed great age, were symbols of longevity, along with the **pine tree**, but during the Mongol Dynasty—when Marco Polo visited China—the **turtle** came to have lewd associations, and since that time it has been assiduously avoided in Chinese art. (In Japan, Korea, and Annam [Northern Indo-China] it has retained its original meaning, however. In fact at the court of Annam the turtle still appears as one of four sacred animals on the state robes of the highest officials.)

Other animals and birds have long been popular because of supposed desirable qualities. For example, the **mandarin duck** and the **quail** have both acquired a reputation for devotion to their mates, and for this reason they are often portrayed in pairs to symbolize domestic felicity. The **carp**, known to the Occident as a sluggish fish, has come to be known in China as a symbol of ambition, and a carp leaping through the dragon gate (***lung-mên***), a familiar subject in all media of Chinese art, represented a successful candidate in the Imperial examinations. This was a particularly important symbol in a land where the highly-organized civil service system made success in such examinations the prerequisite for any official position.

Various trees and plants, such as the **pine**, **cypress**, and **tree-fungus**, have been considered as symbols of great age; while the **pine**, **bamboo**, and **blossoming plum**, collectively known as the "three friends in winter" because they are the only plants to display their colors against the snow, are symbols of constancy. The **Flowers of the Four Seasons** (usually **plum blossom**, **grass orchid**, **lotus**, and **chrysanthemum**, but varying with the individual artist's choice) are popular designs, esp. in paintings, on porcelain, and on rugs.

With the T'ang Dynasty (618-906 A.D.), Buddhism burst into full flower as a state religion, and Buddhist art, already highly developed in China, came into its own, under imperial patronage. Chief among the Buddhist symbols, of Indian origin, was the **lotus**, usually represented with eight petals to recall the Eight Noble Truths taught by the Buddha Gautama. Moreover, as Buddhist deities were commonly shown supported above the earth on lotus-thrones, the flower was also venerated as a symbol of purity and detachment from earthly cares. Because of this, and because it was a familiar attribute of Kuan-yin, "Goddess of Mercy", it became a constant symbol in Chinese art. We must admit, however, that in later centuries its symbolism became less sublime. For artists of recent times have incorporated the lotus with emblems of good fortune to symbolize continuing felicity, since the more common Chinese word for lotus (***lien***) has the same sound as the verb meaning "to continue". (The other word for lotus (***ho***) is a pun on the word harmony, so the lotus is also used in modern rebuses to mean "harmonious".)

Equally significant as a Buddhist symbol was the **Wheel of the Law**, its eight spokes also representing the eight-fold path of Buddha's teachings, and the flames which usually surround it recalling the fact that the wheel was an ancient solar symbol in India and Central Asia. Both wheel and lotus are included in the group commonly known as the **Eight Buddhist Symbols.** (The other six are

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the **vase** and **conch shell**, the **twin fish** and **endless knot**, the **royal canopy** and the **state umbrella**.) All these were Indian symbols of remote antiquity, revered long before Buddhism, and about them had gathered a long tradition. In China, however, they rapidly degenerated into mere lucky symbols, of which only the wheel and lotus retained any special significance.

A number of other esoteric symbols came to China from India by way of Buddhism, such as the **sacred pearl**, the **alms bowl**, and ***vajra***, or ***thunderbolt***, but these do not seem to have excited the imagination of Chinese artists. Except in the Lamaist art of the Ch'ing period in North China, they seldom occur unless as attributes in the hands of painted or sculptured deities. In fact the vajra itself is frequently replaced by a conventionalized Chinese mace.

Taoism began, some centuries before the birth of Christ, as a great philosophical religion, embodying the best of Chinese abstract thought. Even before the Han Dynasty, however, this began to degenerate into a popular faith of mumbo-jumbo and sorcery, much concerned with the pursuit of long life, to be attained by "pills of immortality", and with release from evil influences thought to have been generated by Yin elements. (By now the Yang and Yin instead of representing active and passive forces in harmonious relationship, had come to be considered as the essence of all Good and of all Evil, resp.) This form of the religion, corrupt as it was, even gained imperial favor under some of the T'ang Emperors to the extent that it replaced Buddhism for a time as the state religion. It was inevitable, then, that Taoism should also donate some symbols to Chinese art.

As popular Taoism devoted so much attention to magical methods for prolonging life, it placed great reverence on a series of persons who were believed to have achieved immortality by esoteric practices. Eight of these in particular gained a firm hold on popular imagination. Each of these men or women was identified in art by one or two attributes (flower basket, gourd and crutch, bamboo rattle, lotus, fan, flute, sword, and castanets). In time the attributes came to be painted instead of the personages they represented, and finally the Chinese people believed them to have lucky or wonder-working powers in themselves. Thus the symbols of the **Eight Taoist Immortals**, like the Eight Buddhist symbols, degenerated into mere symbols of good fortune.

The second preoccupation of the Taoists, which lay in finding and exploiting methods of exorcism against evil forces generated by the Yin element, was also linked with the search for longevity since disease and the evil spirits who might try to shorten the span of life were also believed to be embodiments of Yin. Thus, anything associated with Yang was believed to have great power as a counteracting force, and demon-repellent. For this reason, anything colored **red** (the Yang color) was considered as "lucky" for weddings and other festivities, while colorless things, of **solid black or white**, were avoided. Certain flowers, usually red ones like the scarlet peony, and medicinal plants with real or fancied curative properties, such as **artemisia**, were thought to be esp. efficacious in repelling demons,—as were most of the spike-leafed plants, such as the **iris**. The beautiful plant designs on porcelains, rugs, and textiles, were often applied with this intent.

The evil forces of Yin were collectively expressed in art under the form of five loathsome creatures (usually the **spider**, **lizard**, **centipede**, **snake**, and **toad**), together known as **The Five Poisons**. Paradoxically, it was believed that if figures of these animals were displayed, they could ward off the Yin influences which they represented. Hence the five poisons are often seen portrayed in carvings of wood or jade, on textiles or in paintings, sometimes being trodden under the feet of a spirit tiger ridden by Chang Tao-ling, the father of modern Taoism, or more often alone. In this group of five any one of the animals may be exchanged for another equally detestable, but the total number must always remain the same. This peculiarity, already noted in connection with the Flowers of the Four Seasons, may also be observed in other groupings such as the **Eight Jewels** (formerly symbols of sacrifice, but now symbols of luck and wealth in their own right). It would seem that in the Far East the idea of a symbolic number of things is more important than the specific objects themselves. The number **eight** seems to be especially propitious.

Since Chinese characters are usually ideographs—concise and decorative symbols of ideas—it is only natural that they should have occupied a prominent place in Chinese symbolic art. Characters were first used as art forms in the Han Dynasty, when, in groups of four, they were cast on bronze presenta-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tion mirrors, to express wishes of good fortune for the recipient. Centuries later, by the time that painted porcelain came into favor with the Ming Dynasty (1368-1644), such expressions were largely supplanted by single characters for Happiness (**fu**), Longevity (**shou**), and Good Fortune (**chi**). These were ingeniously fitted into ornamental medallions, in reserves left in the principal pattern. Often these were shown in their usual printed form, but sometimes they were written in archaic styles, for variation. Another common form of Ming decoration was the symbol by association of ideas. The many-seeded **pomegranate** was pictured to denote Fertility; **ivory tusks** or a stick of **coral** carried hopes for wealth; while the **Four Attributes of the Scholar** (book, scroll, lute, and chess-board) or the **Hundred Antiques**, pictures of the things dear to the heart of the collector, suggested the much-desired life of a scholar-connoisseur.

Finally, with the Ch'ing Dynasty (1644-1912) when the Manchu conquerors of China managed to destroy much of what remained of the old Chinese culture, the breakdown of religious tradition began to show its effects in widespread superstition and an exaggerated reverence for lucky symbols, even among the upper classes. The former wishes for happiness and longevity were now expressed with far greater elaboration, in the form of pictorial puns, using pictures of objects with the same pronunciation as the character for the quality desired. Thus a **bat**, or an oddly-shaped citrus fruit called the **"Buddha's hand"** were both used to mean Happiness, since the chief syllable of their respective names was pronounced *fu*. Similarly, the **butterfly** came to be a symbol for Longevity, since its name, pronounced *t'ieh*, had the same sound as the word meaning "sixty years of age". This development had begun in Ming, but in later Ch'ing times (toward the end of the 18th cent.) these became so elaborate that whole sentences came to be expressed in pictorial patterns. For example, a halberd, a jade musical stone, and a scepter were combined in a single design which by a pun meant, "May you have as much joy and good fortune as you desire". Along with these more and more involved plays on words, the simpler symbols by association of ideas continued to be expressed, but with the late Ch'ing *horror vacui* they were repeated an infinite number of times on the same object, until they were no longer meaningful, but merely tiresome decorations. It was at this time that the Eight Buddhist Symbols and the Symbols of the Taoist Immortals also reached their ultimate degeneration, no longer considered even lucky, merely decorative. With the demand for constant repetition of all these, by now almost meaningless, symbols, the artists and artisans of the last two centuries were sorely tried in their efforts to produce objects with some originality. It was probably this aridity of subject, as much as the dynastic decline and the impact of Western ideas, that produced the collapse of the Chinese artistic tradition at the end of the 19th cent.

As has been said, the arts of Korea and Northern Indo-China (Annam) are basically derived from Chinese art, and are but provincial expressions of it, slightly altered by environment. Their symbols show few variations, and these tend to be alterations in style and modes of expression rather than innovations in the realm of ideas. Nearly all the familiar Chinese symbols can be found in their arts, with the exception of the more elaborate puns, since they would not be valid in other languages than Chinese. Unfortunately, however, these cultures have suffered at the hands of unappreciative alien rulers, whose colonization policies have been devoted mainly to exploiting the people, and have only favored those arts which were commercially profitable. Thus the traditional arts with all their symbols have been largely abandoned.

Japanese art has also been greatly indebted to the Chinese tradition for ideas as well as for techniques, ever since the influence of T'ang China and Sinified Korea raised the island nation from virtual barbarism. Its symbolism is highly developed and refined, but with very few exceptions the symbols are not indigenous, but have come from China, either directly or through Korea; while some few have come more or less directly from India with itinerant monks. The artistic genius of the Japanese people has not expressed itself in the invention of symbols, but rather in their application as objects of decoration—with great feeling for their secondary and poetical meanings, but often showing little evidence of any comprehension of their deeper significance. The latter statement does not apply to Buddhist symbols, however, for the Japanese, being essentially a more religious-minded people than their continental neighbors have not allowed the Buddhist symbols to degenerate into mere lucky emblems.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The Japanese have a number of lucky symbols, however, which are loosely grouped under the name of **takara-mono**, or "treasure things". These are made up of Chinese symbols of wealth, such as the Eight Jewels, and a few elements from native folklore, such as the magical **feather cloak** (*hagoromo*) and the **mallet of Daikoku**, one of the **Seven Gods of Luck.** Even these seven lucky gods, so popular in Japanese art, are with one exception of foreign origin, though the **treasure boat** (*takara-bune*) in which they are often depicted is a purely Japanese idea. The Japanese have never developed the punning symbols to the same degree as the people of China, partly because the Tokugawa Shoguns were strictly enforcing their isolation policy at the time when these symbols were gaining a vogue in Ch'ing China.

The one field in which Japanese artists are at their best is in representations of Nature. They have been especially partial to Chinese animal and plant designs, often extending the meaning of the latter. Among the plants featured in Japanese art are several which have been ignored in China, notably the **paulownia, wisteria,** and the **maple,** the first of which has been adopted as the crest and symbol of the Empress (as opposed to the Emperor's sixteen-petalled chrysanthemum). Plants and birds frequently appear in rigidly conventionalized forms as motives for the circular crests (*mon*) which are profusely emblazoned on Japanese works of art in silk, metal and lacquer. In this case the motives usually have no symbolic meaning, however, beyond their association with the clan or family entitled to bear the crest. Unfortunately, with the rapid advance of materialism since the Restoration of 1868, and the fashion for aping Occidental Art along with other modern improvements of doubtful value, the symbolic art of Japan is rapidly following that of China to eventual extinction. To the average Japanese of the last decade, the ancient symbols had become little more than pretty decorations, as meaningless to him as they would be to the Western tourist.

Tibetan culture, like the Japanese, is essentially adaptive rather than inventive, but it differs from the latter in being more strictly conservative. While its art is primarily based on Buddhist motives brought from India, and therefore should be studied primarily as an offshoot of the Indian Buddhist tradition, it has drawn almost as heavily from Chinese culture. This is due to the influence of centuries of trade, and the recent position of Tibet as an outlying portion of the Chinese Empire. In addition to the many Buddhist symbols which both countries have in common, the Tibetans have borrowed the *t'ao-t'ieh* mask, the Yin-Yang and the eight trigrams, the dragon with all its connotations, and even the symbols of the Taoist Immortals. Also popular are the simple folk symbols, such as the bat, the **peach of Immortality** (longevity), and the "Buddha's hand".

Thanks to the strong conservatism of Tibetan culture, plus the fact that its tradition is being kept relatively untainted by Western influences, owing to the Government's policy of isolation, Tibet may well remain a living storehouse for the symbols of Far Eastern culture, when the disease of modernism has robbed them of their meanings—and thus their very reason for existence—in the other lands of Eastern Asia. **symbols for colors.** See HERALDRY.

**symmetry.** (1) Comes from Gr. *syn* meaning "with" and *metron* "measure", and means the distribution of the single parts of a work of art around a central point or axis in such a way that equal or similar parts on one side correspond to equal or similar parts on the other side. Comparable to this is the distribution of the parts of the human body; an almost perfect example of bilateral symmetry. In case the axis is indicated by a certain object, perhaps by a human figure, a building, etc., then there is a fixed center. But in case the center is not fixed, then there is an imaginary center. If the corresponding parts are so arranged that the parts can be or can almost be interchanged, then there is a rigid and reflected symmetry. If the cor-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

responding parts are arranged in such way as to be symmetrical but not rigid, then an elastic symmetry results. In case the axis is fixed by an object and the corresponding parts are interchangeably arranged, then centralization will be the consequence, as for instance in the works of the late Roman Empire, in many works of early Christianity, in the Byzantine time, and in the Salian epoch of the Middle Ages. Of all the systems of order, the symmetrical system produces the greatest possible feeling of calm and security in the spectator. But it may also produce the impression of dictatorial rigidity. Generally speaking, one may say that the Greco-Romans favor the symmetrical arrangement, especially in their decorative arts. While the Romans were inclined to a more centralized symmetry, the Greeks preferred the imaginary center and the more elastic arrangement of the corresponding parts. The Renaissance follows more or less either the one or the other direction. See asymmetry. —A.J.S.

(2) *Mus.* Term borrowed from the field of visual experience to designate equal length and similar construction of corresponding phrases. —E.K.

**symphony.** The word symphony (*symphonia, sinfonia, sinfonie*; from the Gr. meaning "sounding together") has been used to designate a number of different kinds of instrumental and vocal compositions and also as the name of instruments on which two or more tones might be sounded together. About the middle of the 18th cent. the word rapidly came to be used chiefly, if not exclusively, for orchestral works in several movements, similar to the sonata. "A sonata for the orchestra" is the common definition of the modern symphony. The word seems not to have been in general use until the early 17th cent. (though Riemann discovered "a symphony" of the 15th cent., Riemann, *Klavierlehrer,* 1898, No. 4) when it is used to designate introductory passages or interludes in opera (Peri, *Euridice,* 1600; Conteverdi, *Orfeo,* 1603) or to distinguish harmonic from polyphonic writing (Rossi, *Third Book of Sonatas,* 1613; Marini, Op. 1, 1617). Several of the ways in which the term symphony came to be used in the 17th and early 18th cents. are found in the works of J. S. Bach, where each of the Three-Part Inventions and the opening movement of the second Partita are called Sinfonia, the introductory movement of cantata No. 54 and the movement in D major from an unknown church cantata are likewise called "sinfonia" and a three-movement orchestral work in F is given the same title. The habit of referring to the introduction and interludes (ritornel) of arias as "symphonies" persisted into the 19th cent. It is the *sinfonia avanti l'opera* or opera overture that forms the chief ancestor of the modern symphony, esp. the 17th cent. Italian form of these overtures (of which A. Scarlatti is the chief exponent), consisting in a movement divided into three sections, fast-slow-fast. When such movements came to be played as concert music, apart from opera (first probably in the late 17th cent.) and the divisions came to be represented by separate movements and, finally, the structural principles of sonata-form were used in the first of these movements, the modern symphony emerged in all its essential features. These developments are found in the works of Stamitz, Monn, Cannabich, Gossec, Boccherini and many others, especially K. P. E. Bach. By the middle of the 18th cent. a classical norm for the symphony had been established, consisting in four movements, the first fast and in sonata-form, the second slow and song-like or in variation form, the third a minuet, and the fourth a lively movement of rondo character. It was this norm which was passed on to the Viennese school (Haydn and Mozart in first rank) with which the symphony in the modern sense of the word comes to its first complete artistic maturity.

The major musical characteristics of their periods and of their composers are to be found in the symphonies of Haydn and Mozart, their contemporaries and successors. With few (though notable) exceptions (Chopin, Mussorgsky, Debussy, *inter alia*) instrumental composers since the close of the 18th cent. have written symphonies and the form has been regarded as one demanding the highest degree of skill and mature comprehension.

In certain of Haydn's 104 authenticated symphonies and of Mozart's 39 or 40 there may be found experimental and tentative efforts toward a satisfactory form and style, whereas others, such as Haydn's last 12 (1791-1795) written for London, and Mozart's last 3, the E-flat, the F minor and the C major or "Jupiter" (1788), are the great masterpieces of the classical style. Beethoven's 9 symphonies (1797-1823) are the great source book in which may be traced the historic change from a classical to a romantic point of view. Beethoven greatly expanded the form as he inherited it and augmented the orchestra, creating a more flexi-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ble orchestration especially for wind instruments. Incisive, boisterous, tempestuous scherzi take the place formerly held by the stately or sprightly minuet. Movements are highly organic and developmental processes are present everywhere. Other forms on which Beethoven left the impress of original treatment, such as the Variation and the Fugue, are included within the framework of symphonic movements. A quartet of solo voices and a full chorus are used in the finale of the ninth. Above all else the mood and manner, personal with their composer, characterize these symphonies, seen in the epigrammatic thematic material, the vitality of expression and the dramatic quality of harmonic and contrapuntal thought. Poetic suggestion is also manifest in these works as elsewhere in Beethoven. The "Eroica" (No. 3, E-flat major, originally dedicated to Napoleon), the dramatic C minor (No. 5), the Pastoral (No. 6, F major) are but the most apparent examples of "poetic suggestion by musical means", essentially a romantic characteristic.

The most notable of Beethoven's contemporaries, Schubert (8 symphonies, 1813-1828) achieved in his C major (No. 7) and "Unfinished" (No. 8) an appropriate, sustained structure for his essentially lyric materials. The romanticists Berlioz (4, 1830-1840), Schumann (4, 1831-1850), Mendelssohn (4, 1824-1832) and Liszt (2, 1853-1861) while employing in the symphony styles highly characteristic of their several individualities, have in common a strong tendency toward the picturesque and the narrative in their thematic material, their forms and treatments. Poetic titles are common and indicative of romantic preoccupation with programmatic suggestion (Berlioz, *Fantastic Symphony;* Schumann, *Spring Symphony;* Mendelssohn, *Reformation Symphony;* Liszt, *A Faust Symphony*).

Brahms' (4, 1855-1885) symphonic thought is more akin to that of Beethoven than to that of his more romantic contemporaries. Strongly personal in idiom and massively constructed, Brahms unites in these works a classical feeling for pure music with a romantic individuality of invention. Tchaikovsky (6, 1868-1893) in his last three symphonies (the *Pathétique* is No. 6) represents an extreme of romantic expression. In the main sombre and suggestive of melancholy protest to the point of vehemence, these works are masterpieces of the decadent romanticism of the late 19th cent. César Franck's one symphony (1888) is likewise highly individual in thematic materials and treatment and non-programmatic. Dvorak (9, 1865-1880) left in his "New World" symphony one of the most successful of works in a national or racial musical idiom. Bruckner (10 finished, 1 unfinished, 1863-1894) and Mahler (9 finished, 1 unfinished, 1888-1909) wrote large-scale works, involved in structrue and crowded with materials, beside which Sibelius (7, 1898-1924) with his new interpretations of form and melodious, nationalistic thematic material and strikingly picturesque scoring seems direct and simple.

These are but the few most frequently heard composers who have contributed to the extensive literature of the symphony. Even a brief account of the history of that literature should not omit mention of Spohr (10), Strauss (3), Glazunoff (8) and Scriabine (5) among the men who have written symphonies of historical value if not of permanent interest.

With those interpretations of form and those widely different idioms that are indiscriminately grouped together as "modern" the symphony in the present century, as in the 19th, has represented most of the characteristic musical thought of the period. There are belated romanticists (Chadwick 3, Hadley 4, Vaughan Williams 4, Rachmaninoff 3), and there are men who revitalize older procedures (Bloch 3, Bax 6, Hanson 2) and others who maintain the fundamentals of accepted tradition, following them to conclusions not previously realized (Sessions 1) and there are the "radicals", Hindemith, Stravinsky, Shostakovich, again to mention but a few.

The changes that have been brought about in the form of the symphony, the offshoots of symphonic procedures (such as the symphonic poem) and the immense bearing of the constitution of the orchestra and the methods of orchestration on the symphony as a form of expression are subjects to be treated elsewhere. **synagogue music.** See JEWISH MUSIC.

**synagogue music in America.** See JEWISH MUSIC.

**synagogues.** Since the Service of the synagogue consists mainly of prayer and Scripture reading the architecture of the synagogue could never have any connection with that of the Temple at Jerusalem where both Service and architecture had been based on sacrifices and on a highly developed ceremonial. Consequently the simplest examples of synagogues in Antiquity are plain rectangular rooms, sometimes with a courtyard on one side (Aegina I and II, the later one 5th cent. A.D.; Isfiyā, 6th cent. A.D.; perhaps Delos, 1st cent. B.C.). A seat, probably for the leader of the congregation (*archisynagogos*), flanked by benches (for the Elders (?)), occupies one of the short sides; the Ark of the Law, containing the Scrolls (*aron hakodesch*) and the reading platform (*bema*) may have been wooden; the Ark was brought in for Services only and placed on the side towards Jerusalem. Throughout Roman-Hellenistic Antiquity synagogues were nothing but ecclesiastical variants of Roman secular meeting house patterns such as *curiae* and *basilicae*. Consequently they are either single-naved or basilical in plan, in the latter case with aisles, rarely on four sides of the nave (perhaps Alexandria, before 2nd cent. A.D.), more frequently on three (leaving free the entrance side facing Jerusalem), and often with upper galleries for the women (Galilean type, 3rd (?) 5th cent. A.D.: Kerâze; Irbid; Capernaum-Tell-Hum). Elsewhere the plans show only two aisles flanking the nave (Meron), often with an *atrium* in front (Miletus, 4th cent. A.D.). Stable structures for the *aron* appear from the 4th cent. on (Tell-Hum, rebuilding). At Gerasa (ca. 400) a rectangular niche terminated the nave, reversing the orientation. A small niche to contain one scroll during Services had already occupied the center of one of the long walls of transverse synagogue rooms, situated within larger edifices, at Dura-Europos, I and II (200 and 245 resp.) and at Hammam-Lif (4th cent. A.D.). Later synagogues, depending on small Christian basilicas, show semicircular apses (Hammath-by Gadara, 5th cent. (?); Tell-es-Sultan, 8th cent. and also occasionally a narthex (Beth Alpha, 518-27 or 565-78). The walls are decorated with figured frescoes (Dura), the pavements with figural or decorative mosaics (Hammam-Lif; Hammath-by-Gadara; Beth Alpha); capitals and friezes are richly sculptured (Tell-Hum). Their style like the plan conforms to the local (Syro-Palestinian, North African, Greek) variants of Roman-Hellenistic art.

Entirely different are the synagogues of the Middle Ages in Germany, Bohemia, Poland. From the 12th to the 16th cents. the prevailing type is a two-naved vaulted hall with from one (Eger, 1347-75) to three (Regensburg, 1210-27) supports along the center axis. The pattern is known from medieval secular structures, refectories and libraries; the style follows that of contemporary non-Jewish architecture with Romanesque (Worms, ca. 1175, destroyed 1938) or Gothic (Prague, ca. 1300; Cracow, 16th cent.) vaults and capitals. A richly decorated Ark occupies the short Eastern side, facing Jerusalem, a *bema* the center of the building. The decoration is purely ornamental without any figure design. In simple structures the plan is single naved (Speyer, ca. 1100; Miltenberg, late 13th cent.). Occasionally small rooms for women were added to the main building (Worms, 1213).

Like central European medieval synagogues the Spanish ones follow the local, this time the Moorish style. In plan they resemble mosques with one (Cordova, 1315; Toledo, S. Maria del Transito, 1357), three (Segovia, 13th cent. (?), destroyed 1899, rebuilt) or five aisles (Toledo, S. Maria la Blanca, ca. 1260 (?)). They all are splendidly decorated with stucco ornament and rich capitals. Yet unlike mosques their main axis is longitudinal rather than transverse, the nave is higher than the aisles and women galleries open on the entrance side. As a whole the type resembles Christian and Islamic ecclesiastical rather than secular architecture, contrary to the custom of central European Jewry.

New types appear from the 16th through the 18th century in Eastern Europe. The city synagogues are square stone buildings in Late Renaissance and Baroque forms, frequently fortified; their vaults are supported by four piers around the central *bema* (Lwow, 1632; Zolkiew, 1692; Wilna ca. second half of 17th cent.). This pattern is popularized in Russian-Polish Baroque village synagogues. They are small, square wooden structures

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

with high peaked roofs, sometimes with low corner towers and often surrounded by deep porches. The interior shows complicated wooden vaults and lavish ornamental wall and ceiling paintings, a rich Ark of the Law and *bema* (Chodorow; Przedborz; Nasielsk, 1692; Kurnik, 1767). From Poland this type was carried to Southern Germany (Bechhofen, 1727-28; Horb). Retranslated into stone and into more sophisticated forms it appears in the Rococo synagogues of Western Czechoslovakia (Kuttenplan, 1756-9; Neuzedlisch, 1786).

In contrast to this Jewish variant of an Eastern peasant baroque and rococo, contemporaneous Western synagogues follow more modish patterns. The Italian synagogues are squarish or rectangular rooms, due to police regulations frequently on the upper floor of a house. Women galleries accompany the main room on a higher level either on one of the short or on the long sides. *Aron* and *bema* (at opposite ends of the room), chandeliers and walls are richly decorated in a splendid baroque (Venice, *Sc. Spagnuola,* rebuilt 1654/5, architect B. Longhena; Mantova, 1751) or an elegant Rococo (Venice, *Sc. ashkenasi,* rebuilt 1745; Ancona, ca. 1750; Cavaillon (Southern France), 1772/3). Vaulting is rare (Padova, *Sc. italiana,* 16th cent., rebuilt ca. 1750).

Far more important for the future development was a 17th cent. plan in which the nave is surrounded on three sides by aisles and galleries. It seems to have prevailed among the Spanish-Portuguese congregations in Italy, Holland and England, and resembles Protestant church types. At Leghorn (1591, rebuilt 1602, rococo decoration added in 1789) double galleries surmount the aisles. Dutch and English synagogues use a classicist vocabulary. The Portuguese synagogue at Amsterdam (1675) has three naves of equal height, supported by tuscan columns; the aisles are partly filled with galleries; an enormous *bema* stands near the entrance, a "classicist" Ark of the Law at the east wall. Similarly classicist, but only single naved with galleries, is Bevis Mark's synagogue in London (1699-1702); Harrison's synagogue at Newport, R. I. (1763), and the demolished synagogue at Charleston, S. C. (1792), have their naves surrounded on three sides by aisles and galleries on light classicist supports.

The simple and "functional" plan and the limpid classicist vocabulary of this Western synagogue type (cf. also Munich, 1824/5, demolished; Buchau, ca. 1830; London, Duke's Place synagogue, 1722, rebuilt 1830) is superseded from the middle of the 19th cent. on by more intricate patterns which follow Romanesque or Gothic church plans, incompatible with the requirements of the synagogue Service, often with towers at the façade and over the crossing and with richly developed apses. The ornament is frequently "Byzantine", "Moorish", "Romanesque" or "baroque" or a fanciful mixture of all these styles (Munich, 1884/7, arch. A. Schmidt; Philadelphia, Mikveh Israel; New York City, Temple Emanuel, 1929, arch. R. D. Kohn, Chs. Butler, Cl. Stein). Occasionally a dome rises from a Greek cross structure (Florence, 1883; Augsburg, 1914, arch. F. Landauer; Buffalo, N. Y., Beth Zion, 1890, arch. Ed. A. Kent). Only recently has modern architecture penetrated into synagogue architecture (Plauen, 1929, arch. F. Landauer). **takaramono** (Jap.). Precious things: anchor, cowrie shell, copper coin, coins in a chest, weight, purse, key, jar of valuables, fan, bridge of the harp, clove, mallet, hat of inviolability, raincoat, feather robe, rolls of manuscripts, rolls of fabric, coral, sacred gem. See SYMBOLISM IN FAR EASTERN ART. —J.A.M.

**Takatori yaki** (Jap.). Pottery made in province of Chikuzen by the potter, Takatori.

**takya** (Ar.). In the Ottoman Empire, a dervish hostel. See ISLAMIC ART.

**Talavera ware.** See SPAIN, ART OF.

**talea.** See MEDIEVAL MUSIC.

**talisman.** See JEWELRY.

**tall tale.** See American folk forms, in literature.

**tall talk.** See American folk forms, in literature.

**tambourine.** See MUSICAL INSTRUMENTS.

**tambur.** See MUSICAL INSTRUMENTS.

**tan** (Jap.). A wood-block printing color derived from red lead.

**Tanagroa.** One of the chief Polynesian gods.

**Tanba yaki** (Jap.). Pottery made in Tanba province.

**tan-e** (Jap.). A primitive woodblock print in which the only color, or the predominating one, was a red oxide of lead, somewhat orange in tone.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**T'ang art.** See CHINESE ARTS.

**T'ang dynasty porcelain.** See CERAMICS-II.

**tango.** The **Spanish tango** is one of the group of **flamenco** dances, distinct from the classic Iberian group in that the former embody elements of traditional gipsy dance. The flamenco dances belong to the café and theatres, rather than to rural or social gatherings, since they developed through professional dancers' appropriation of gipsy figures and manner.

The Spanish tango is danced by a woman. It is characterized by sudden dynamic changes from flowing to vigorous, percussive movement. The rhythmic pattern of the dance is accentuated by heel and toe tapping, clapping, and finger-snapping. The use of castanets belongs almost exclusively to the Iberian dances.

The **Argentine tango** bears little similarity to that of Spain, being a couple dance and quite different in style. —J.G.

**tank furnace.** See GLASS AND GLASS-MAKING.

**tansai-e** (Jap.). Black and white painting with the addition of colored tints.

**tanto** (Jap.). A short daggerlike sword.

**tan-ye** (Jap.). See JAPANESE ART.

**tanzaku-e** (Jap.). Paintings on poem papers.

**tao t'ieh** (Ch.). A decorative motive commonly used in Chinese art. The face of an ogre or mythical animal form. See PRIMITIVE ART; SYMBOLISM IN FAR EASTERN ART.

**tapa cloth.** A cloth made by pounding into a thin sheet the pulp from the inner bark of certain trees found in the various islands of Oceania. See OCEANIA, THE ARTS OF.

**tapes.** *Book.* Tapes are used for sewing the sections to, but the term is sometimes applied generically to the strings to which the sewing is carried.

**TAPESTRY** permits a free non-repeating design and unlimited polychromy, for it is woven, not with a loom set to pattern for the passage of shuttles the full width of a shed, as are yard-goods, but with bobbins each used to insert its yarn only in the area where the pattern requires that color. The usual weave is simple **cloth** or **tabby binding**, over and under the warps alternately, and in the following passage under where before it was over, and so on. The interpenetrating of the differently colored areas in a mosaic, for which the design must provide, prevents the fabric from falling apart when removed from the loom, but wherever the margin between two colors is straight and coincides with the warp direction, a slit results. These slits may be dealt with in any of five ways: (1) left open, when they may be deliberately exploited in the effect of the finished weave—a characteristic, e.g., of the Chinese silk tapestries, called, for this reason, ***k'ssu*** (cut silk), and of so-called ***khilim*** rugs; (2) sewed up after the tapestry is removed from the loom —the usual procedure in European tapestries before the 18th cent., the sewing being necessary to prevent tearing at the ends of the slits because the warps are horizontal and the considerable weight of the relatively coarse wool fabrics would otherwise drag on the slits; (3) dovetailing—passing the threads of the juxtaposed colors alternately over the common warp either (a) single—**comb dovetailing**, or (b) in groups—**serrated dovetailing**—found, often combined with unsewn slits, in Egyptian early medieval ("Coptic") tapestries; (4) interlocking—looping each weft through the weft of the adjacent color in the same line of weave—typical of the elegance of the **Gobelins tapestries** from the 18th cent.; (5) passing a fine, cloth-woven weft the full width between every two tapestry-woven wefts, which, in compacting the weave, conceal the binding weft—a peculiar variant that almost contradicts the technical definition of tapestry, found in Japan (8th cent.), East Persia (10th cent.), and Peru ("medieval").

In the simplest tapestry the warps, all on one level, are vertical in relation to the design—as in *k'ssu*, but European weavers, at least by the 14th cent., almost always rendered the design at right-angles on the loom so that the warps would run horizontally when the panel was hung, the rather marked ribbing thereby helping to bind the pattern into a continuity, instead of severing it with vertical shadows. A more definite texture is effected by warps on two levels—depressed in regular alternation—in a small group comprising the Japanese and East Persian pieces with an alternate full-width cloth-bound weft, and also slit Persian silk tapestries of the Seljuq (11th cent.) and Safavid (mid-16th cent.) periods.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

In fully evolved tapestry weaving the wefts are kept strictly at right angles to the warps, as in good shuttle weaving, but in more "primitive" types (e.g., "Coptic") they may slant and curve, sometimes considerably, following the design. Persia also employed in the Safavid period—though likewise rarely—a variant dovetailing: a black weft serving as outline dovetailed (usually, perhaps always, "comb" dovetailed) between color areas where there would otherwise be a slit, and elsewhere freely curved to follow the pattern contours.

At an early period a special technical adjustment was evolved in order to employ tapestry weaving to create spaced polychrome motives in a plain cloth (typically white linen): the interruption of the shuttle weaving at each spot where pattern was desired, leaving exposed the warps, when they may be combined in groups, each treated as a single warp in the tapestry weaving. The pattern in this case may parallel the warps (i.e., warps vertical in relation to it) or—far less often but sometimes necessarily in a shaped garment design—run at right angles.

The technique first appears in Egypt in a linen cartouche of Thutmose III (1463-1451 B.C.) and another cartouche of his son, Amenhotep II (1451-1420 B.C.), but whether Egypt is to be credited with the invention of tapestry remains undetermined, probably undeterminable. It is an obvious fallacy to attribute to certain countries (e.g., Egypt, Peru) the initiation of textile techniques simply because their conditions are favorable for subsoil preservation over long periods. From the time of Thutmose III, Syrian war prisoners appear in Egyptian records and the Syrians were famous as expert weavers.

All textile material except plain cloths (chiefly linen mummy wrappings) are very scanty until about the Christian era, but a continued use of the tapestry technique is almost certain, though its diffusion in the interval cannot be even guessed. In the Han period it appears in the Far East (Loulan fragments), and shortly thereafter in the Paracas culture in Peru where llama wool and native cotton are used. Probably other American cultures were producing comparable fabrics that have disappeared. Some anthropologists still defend the old anti-diffusionist theory of an independent invention in the Western Hemisphere of this and the numerous other techniques utilized in the pre-Columbian civilizations, but to an ever-increasing predominance of students the number and variety of points of identity between Asiatic and American cultures (notably in textile techniques), and the small margin of fundamental divergence in the latter, puts any thesis of parallel development beyond the most liberal interpretation of probability. Until, therefore—or unless—the contrary is proven, it must be assumed that tapestry weaving, like so many other processes and ideas, moved from a place of origin somewhere in the Near or Middle East, to Eastern Asia, to the Western Hemisphere. There its use, with some variations, can be traced with reasonable continuity, chiefly through specimens preserved in Peru, down into the Spanish period. The Peruvian patterns are composed from the symbolic motives common to their other textiles and also pottery and metal: human figures, often holding a staff, masks, felines, birds—all reduced to geometrical outlines. The dyes are strong and clear and fairly numerous. After the Conquest, Spanish designs, including armorial bearings, were executed by the native craftsmen who imparted thereto a hybrid quality that has its own piquant charm; and thereafter in many uses the technique persists in various parts of the Western Hemisphere to our own time.

In China, likewise, surviving examples form a reasonably continuous series from the Han period on, though the dating of specific pieces even as late as the Ming Dynasty is more often than not problematical. From the T'ang period, at least, the technique appears almost exclusively in the thin, fine-textured slit tapestry (*k'ssu*) of silk (frequently supplemented with "gold" thread made of gilt paper strips spirally wound on a silk core), common down to today, and the patterns are drawn from the characteristic Chinese repertoire: stylized flowers, symbols, naturalistic bird and flower compositions, and illustrations, including religious themes. The weave has been put there to a wide range of uses, from small rectangles to enrich the outer mountings of hand-scroll paintings, to large wall panels, and also garments, including coats and slippers, or garment trimmings—very characteristically the square which from the Manchu conquest designated rank, civil or military, on the breast and back of officials' coats.

Chinese weavers were settled in Japan at intervals in the 3rd and 4th cents. A.D. and probably brought there tapestry, as well as various shuttle weaves. Here, too, slit tapestry has been the rule, executed in silk, often

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

with the wound gilt-paper thread, and judging from the specimens in publications and Western collections, has been used chiefly for panels of moderate size such as gift cloths (*fukusa*), with the typical decoratively treated figural, animal and flower motives even more familiar in Japanese embroidery.

Korea had a well-established silk-weaving industry somewhat before Japan, doubtless likewise derived from China, but the early history of tapestry there seems obscure. In recent times coarse wool slit-tapestry rugs have been made, with broad and effective conventionalized bird and flower designs and abstract motives.

Examples of Near Eastern tapestry became numerous in Egyptian burial grounds from the 4th or 5th cent. A.D., so numerous indeed that the wealth of material (unfortunately labelled as a rule "Coptic") still has not been adequately studied. The bulk of these pieces are fragments from tunics, cloaks, cushion covers, or (far less often) wall hangings, in the pre-Islamic period woven almost invariably with wool and linen wefts—occasionally with some cotton, usually white—on linen warps. A few silk pieces from this time are known, and after the Islamic conquest silk becomes common, though coarser wool types are by no means discontinued.

The pre-Islamic material falls principally into three classes: (1) Egyptian-woven indigenous patterns in either (a) silhouette, almost always violet wool of some tone (occasionally dark blue) and natural linen, or (b) polychrome; (2) Egyptian-woven copies of Near Eastern designs, almost always polychrome; (3) Near Eastern renditions of Near Eastern designs—a class almost wholly neglected in the literature. The indigenous patterns comprise, on the one-hand, strapwork and other formal compositions, and, on the other, figures—human, animal, plant—derived chiefly from the popular eschatological cults, though occasionally major Hellenic deities (e.g., Hermes, Dionysos, Orpheus) are depicted. Christian symbols, notably various forms of the cross, are fairly common, Christian figures rare.

The bichrome silhouette style, though it tends to break down in the 6th and 7th cents. into a rather ambiguous polychrome silhouette style, with details in red, green, or mustard-yellow (or combinations thereof), also continues in pure form well into the Islamic period with a corresponding change of motives, esp. fine renditions of conventional lotus patterns being attributable to the Tulunid period (875-905).

The most usual Egyptian use of the tapestry technique in the Islamic period was for the rendition of bands, varying in width from a half inch to a foot or more, or less often medallions, in silk (rarely enriched with metal thread) in linen cloth for garments (turbans, belts, etc.). The patterns are largely stereotyped—e.g., chains of small hexagons or other units framing more or less degenerate lions or ducks between line-schemes or set in strap patterns, and calligraphy—Kufic types, some very handsome, giving way in the 12th and 13th cents. A. D. to cursive styles. The inscriptions are most often formulae of blessing or good wishes, but quite often Koranic or from prayers; not infrequently they contain parts of the protocol or even names of rulers, and there is a considerable number which indicate the place of weaving (*tirāz*), though these are even more numerous in embroidery than in tapestry weave.

The 5th and 6th cent. A. D. specimens attributable to Syria can be assigned in many instances to specific cities through internal evidence, stylistic and iconographic, but the Syrian tapestry of the following centuries seems to have practically all been destroyed. A notable exception—often arbitrarily assigned to Europe—dateable in the 10th or 11th cent., with a griffon felling an ox, in large roundels, was found in the Church of St. Gereon, Cologne, and is now divided among the Berlin Museum, the Germanisches Museum, Nuremberg, the Musée du Tissu, Lyons, and the Victoria and Albert Museum, London.

A small series of wool tapestry fragments of the 7th and perhaps 8th cents. A. D. showing bird figures, chiefly ducks, usually on a fine red ground, and a larger piece with a cock, in the Hermitage Museum, Leningrad, can be assigned to Syria, again only from internal evidence yet with a reasonable degree of probability.

A large unique wool fragment in the Moore Collection, Yale Museum, showing the forequarters of a running goat in a vigorous semi-abstract style, is characteristically Sasanian.

The weave has continued to be used in the Near and Middle East in silk and linen for towels, belts, table-covers, etc. (especially Syria), mostly with geometrical designs, and for rugs in wool (rarely silk, occasionally elaborated with metal thread), with stylized plant or conventional patterns (Persia, the Caucausus, Asia Minor, Southeast Europe).

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

A special variant of the technique is typical of Persia and India, with the "tabby" binding supplanted by a twill weave over-and-under-two (or "warp-and-weft-twill-over-two"). This is employed characteristically in fine goats' hair or wool for garments: shawls ("Kashmir" and "Kirman" shawls), belts, coats, etc., the most typical pattern-motive being the mis-called "palmette", a round-bodied, sharply pointed ovoid with the tip turned over, which can be traced back to a foliage origin in Syria in the 6th cent. A. D. but has been given numerous fantastic interpretations. The earliest use of a twill-tapestry weave so far noted is in Persia in the 16th cent., and this particular type was established there at least by the mid-17th cent. (examples: Metropolitan Museum; Moore Collection, Yale Museum).

European countries were certainly weaving tapestry by the 12th cent. and quite probably long before. The earliest remaining examples —notably the Halberstadt Apostle tapestry— show an imperfect control of the medium, resulting in meagreness of detail and rigidity of delineation, qualities smoetimes extolled as "primitive"; this set, however, and other isolated panels like a Norwegian fragment illustrating two of the Months in the Oslo Museum of Industrial Art, represent semi-amateur work, executed in convent or castle, and may not, therefore, give a just impression of the standards of the time.

Most of the tapestry weaving of Germany and Scandinavia continued to be of this domestic type until well into the 16h cent.—small panels, for the most part, with doll-like figures, almost always vested with a naive charm, none the less beguiling for being in large part accidental. The work of the various German provinces and towns has been systematically classified by Dr. Betty Kurth (*Die Deutschen Bildteppiche des Mittelalters,* Vienna, 1926), who also has identified the literary sources of many of the designs.

The earliest examples of a fully evolved professional European tapestry art are the remnants of the great Apocalypse series of Angers Cathedral, the Mackay King Arthur, now in the Metropolitan Museum, and a closely related unpublished and unexhibited set of the Heroes. All are the work of Paris weavers of the 14th cent. and are based on cartoons determined by the book-painting of the period. Time and circumstances have been unkind to the great Apocalypse, woven (1376-1381) by Nicolas Bataille after designs of Jean de Bruges, for the Duc d'Anjou, yet it is still aesthetically the greatest European tapestry known, combining clarity without sacrifice of content for exploration, and variety without intrusive devising, with intensity and exalted elevation. The manuscript illustration style of the time was ideally adapted to tapestry—vigorous silhouettes, with highly simplified interior modelling, and varied enrichment of accessory detail.

From the beginning of the 15th cent. the chief focus of the industry in Europe shifts from France to the Low Countries. An interest in 15th cent. tapestries was reawakening in the 1st half of the 19th cent. (A. Jubénal, *Les anciennes tapisseries . . .*, Paris, 1838), but no really systematic scholarship was devoted to them until the 1920's, and by that time the more thoughtful art historians were transferring their emphasis away from mere attribution, whether to schools or masters, towards interpretations, in terms both of cultural history and of aesthetics. Consequently the "cataloguing" of this material is still rudimentary. Dr. Betty Kurth identified the Tournai school; the Brussels school of the end of the century is well known; and an attempt was made to establish a Touraine school, but it dissolves under critical reexamination and its components are reabsorbed into Low Country groups.

Similarly, but for somewhat different reasons, an attempt to identify individual masters —primarily cartoon designers, secondarily loom-heads—has thus far proved largely abortive. In 1904 Joseph Destrée with the aid of "signatory" inscriptions identified a "Maître Philippe", and in 1907 A. Thiéry undertook to assemble the work of Jean van Roome. The results of both included ambiguities and errors—as is inevitable in pioneer work—and progress in that direction has been checked, chiefly by two circumstances: the difficulty of the epigraphy, for which a technique has to be forged *de novo;* and the standardization of attribution methods in current art history, and resultant automatic rejection of so fundamental a revision.

The fact remains, however, that this epigraphic method, combined with a more penetrating application of stylistic analysis, provides the definition of a 15th cent. Bruges school—hitherto completely neglected and of special interest in view of the major cultural role of that city at the time—comprising a dozen nameable masters; four or five ateliers in Tournai, in which more than a score of designers can be distinguished; an Antwerp school, likewise hitherto disregarded, with a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

half dozen marked personalities; and in the welter of late 15th and early 16th cent. Brussels production, at least eight or ten individuals.

Such attribution does not constitute art history but it does provide classification and definition of interrelations which are preliminary to historical interpretation. Some work has been done on the literary origins of certain of the large series—notably the *Roman de Troie*—but the full discussion of this, and especially of the social setting of the Low Countries' "Gothic" tapestry is still in the making.

The Flemish 15th cent. panel-painting styles, of which the cartoons were a reflection or adaptation, depending on the subject, also were well fitted to tapestry execution: a robust objective narrative sense, energetic delineation, decoratively conventionalized modelling—esp. of drapery—and an unflagging interest in accessories: plants, animals, objects, architectural elements, dress patterns, armor details.

Particularly attractive is the *menue verdure*, now called in the trade *mille-fleurs*, type, with little flowering plants often combined with small shrubs—esp. oak, apple, or orange bushes in blossom and fruit—closely sprinkled over the entire ground (usually dark blue, very effective when light red, rarely green, in early 16th cent. sometimes beige), frequently with birds and small animals interspersed, and later degenerating into ambiguity by the addition of a band of landscape at the top. *Menues verdures* also serve as background for armorial bearings and for personnages.

The intrusion of Renaissance taste is sudden and sharp in the history of tapestry, well typified by the Apostle series designed by Raphael and first woven by Pieter van Aelst of Brussels (1515). Scale is greatly magnified; silhouette is subordinated to substantial modelling; illustrative groupings and sequences give way to compositions organized in three dimensions; accessory detail is largely eliminated in favor of space, air and light—the latter a novel element that heightens the chromatic key, thereby diluting the palette, and encourages the use of silk. Metal thread enrichment, occasional in the preceding century, also becomes more frequent, evolving in the most ostentatious examples into "basket-weave" brocading. Painting *per se* takes precedence over narrative action. All these innovations were ill adapted to the flat, flexible, thick, ridged material of tapestry, which to function most successfully should be equally interesting near and far, and offer material for ruminative exploration without being self-assertive.

The purely decorative elements—properly a central concern in tapestry design—are now relegated largely to borders, which become proportionately larger, more complex and more varied.

Bernard van Orley compromised between the preceding Flemish style and the new trends successfully—notably in the so-called "Hunts of Maximilian." The distinctive verdure of the time (***grosse verdure***) is composed of large, scrolling foliation of acanthus inspiration, often combined with other big-scale plants, birds, sometimes butterflies, and larger animals than hitherto—hounds, lions.

In the course of the 16th cent., weavers dispersed from Brussels, the chief center of the industry, and Antwerp to many other European cities, a movement considerably stimulated by Protestant persecutions initiated by the Spanish Government, and shops were set up in England (Sheldon works—c. 1560; noted for tapestry maps), Sweden (Gripsholm, 1540; Stockholm, 1549); various German cities; Fontainebleau (c. 1540), certain Italian cities (Ferrara, 1536; Florence, 1546) and later in Paris. Each developed its own more or less distinctive variation of the common style. The monumental classicism which was the dominant ideal reached new extremes in the work of Peter Paul Rubens and his followers.

The 17th cent. saw the founding of important new shops in England and France: in England at Mortlake near London (1619), where Lowland influence remained strong; and in Soho, London (1685), distinguished for its chinoiserie panels; in France, the great state-patronized factories. In Paris the new enterprise, which was in part derivative from preceding looms manned by Netherlanders, was set up (1667), along with ateliers for other decorative crafts, in an old factory in the Faubourg St. Marcel built by the Gobelins family, which gave the whole organization its name; in Beauvais (letters patent 1664) the factory was almost of equal status; in Aubusson (royal patent 1665; previous private looms) less expensive, coarser work was for the most part done.

The French Court placed lavish orders; outstanding p a i n t e r s provided cartoons (Charles LeBrun, Claude Audran le Jeune, Antoine and Charles Coypel, J. B. Oudry, François Boucher, Jean Bérain, François Desportes, etc.); the rich developments in French domestic architecture and furnishing promoted

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

corresponding accomplishments; the dyers perfected a greatly increased palette, with a large range of intermediate nuances; silk was more freely utilized; and finally in the Gobelins, interlocking was devised to obviate slits invisibly. The weaver could duplicate the work of the painter.

The discriminating decorative taste of the 18th cent. prevented this virtuosity from being unfortunate, as it subsequently became, and the skilful use of birds, flowers, urns and other decorative objects, and architectural elements—mouldings, columns, balustrades—together with grace of composition and drawing, lifts the best work of the period to a high artistic level.

Meanwhile Brussels and neighboring cities had been adjusting their repertoires to the changing taste, in general, however, with less success, though the verdures of the time—wooded landscapes with limited vistas, often showing fountains, small figures (huntsmen, peasants, by or in the style of the Teniers)—have considerable decorative merit.

The 18th cent. again saw a dispersal of weavers, both Flemish and French, for the founding of new looms abroad: Madrid (1720, royal patronage 1746), famous for renditions of cartoons by Goya; St. Petersburg (1716); Naples (1783), etc.

William Morris, as one of his efforts to revive the old hand-crafts, established the Merton Abbey looms (1877), where cartoons, by members of the pre-Raphaelite school were executed.

The craft survives in the West today for repairs (and occasionally falsifications), but while efforts have been made to restore it to a genuine creative activity, notably in the Beauvais works where cartoons were ordered from painters of the so-called "modernist" school (i.e. Paris decadent school, c. 1905-1925), the medium is probably now hopelessly anachronistic.

For a classified bibliography on European tapestry see: J. J. Marquet de Vasselot, *Bibliographie de la Tapisserie,* Paris, 1935; also extensive references in: H. Göbel, *Wandteppiche,* Berlin, 1923-1934. —P.A.

**tarantella.** A mass of legend has accumulated around this famous Italian national dance. According to one tale, the bite of the tarantula spider caused nervous disorders which could be cured only if the victim performed a specified dance to a traditional melody, dance and music thus acquiring the name "tarantella." Another legend asserts that the medieval disease, tarantism, produced spasmodic motions which became the basis for the dance. Most creditable is the account that describes the dance as originating in the region of Tarantum, from which it took its name. It is a couple dance of fast running steps and rapid turns punctuated by poses suggestive of the courtship theme. The woman carries a tambourin, with which she produces a variety of tones and rhythmic patterns in the characteristic 6/8 meter. See St. Vitus dance. —J.G.

**tarantism.** See St. Vitus dance.

**Tarascan.** A term loosely applied to the various local cultures which flourished in western Mexico and occupied different positions in time and space. There is no evidence of their having been made by the same people. —G.C.V.

**tarsia.** See intarsia.

**TASTE AND ITS EDUCATION.** Taste became a major technical term in western philosophy of fine art in the 17th cent. Its chief meaning in 17th and in 18th cent. theory was a sense or sentiment of good form, and its chief use was in explanation of the formal excellence of classical art. The prevailing explanation in terms of conformity to exact rules and rational laws did not satisfy. Good form was held to be irreducible to mathematical regularity and canonical exactness. It was a matter of sentiment, of feeling, of the heart, and taste was understood as a feeling for a charm, a nuance, a grace which was at once the soul of classical beauty and inexpressible by mathematical or scientific law. Shaftesbury, Hutcheson, Hume, the so-called **School of Taste** generally, illustrate this usage. Probably however its most rigorous formulation in general aesthetics was in the *Critique of Judgment* by Kant. Taste is defined there as a disinterested judgment whose basis is the feeling of pleasure, not concepts. Taste is the sense of beauty, but more exactly it is a feeling of the fitness of the form of objects to our perceptual powers. Taste is a feeling for the presence of "good" form, and, although this feeling is said by Kant to be universally valid because it arises from an agreeable play of cognitive powers equally shared by all, its universality and validity are denied to rest upon conformity of the object to rational concepts or to exact rules and scientific laws. In some circles to-day taste retains this 18th cent. meaning, a feeling for excellence of form. Not only formalists but nonformalists such as T. M. Greene agree

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

that pure taste is man's response to mere formal beauty. But since the 18th cent. taste has acquired other meanings. 19th cent. romanticism insisted that content even more than form, powerful emotions even more than pleasing designs, are the properties of aesthetic excellence in the arts. As a result taste in art came to mean man's response to the qualities of emotion and expression even more than man's response to the nuances of form. Finally, in 20th cent. philosophy of art taste is often used not only in these two senses but also to designate man's response to aesthetic qualities of any type, material or formal, contentual or functional, instrumental or terminal, etc.

The topic of the education of taste brings up more immediately than this variety of meanings the famous maxim ***de gustibus non est disputandum***. The 17th-18th cent. theory of taste implies that this maxim is correct. Questions of taste cannot be decided by concepts and rational laws. Tastes are nonrational, disputations regarding them cannot eventuate in objective and rational decisions. Some have taken this position to imply that education of taste in art is futile and that nothing can be done except to ridicule those who attempt to provide such education. But the problem is not so simple even after acceptance of the "de gustibus" position of 17th-18th century theory. The fact is that we feel in terms of what we discriminate in the object felt and we discriminate in terms of what experience teaches us to be there, or in terms of what we know. As a consequence there is one great and good task for education of taste even within the subjectivism of the early modern theory, *viz.* the illumination of the field of taste, the increase of our knowledge of what is there for judgment. In the fine arts this still remains an extraordinarily urgent and important undertaking. Most people today know little of what can be discerned in the arts for taste and judgment. In a painting, for example, they may observe certain obvious items such as the subject, the person or countryscene or dramatic incident being portrayed. But they are not likely to be very vividly aware of the precise properties of the color and lines and lights and darks and shapes and organization, or of the exact shadings in the expression of abstract qualities, of personal and technical qualities. Comparative analytic discussion of paintings on view can serve to bring these and other properties into clear forceful light so that persons previously unlearned in paintings begin to see with some definiteness what otherwise would have remained very vague and indefinite, or not perceived at all.

In supplying knowledge about the arts, educational method may go astray into two equally objectionable extremes. It may provide merely external knowledge, such as information about the artist's life and times which is not integrated with his particular concrete creations, or descriptions of identifying tags of his art without insight into their characteristic properties as art elements. This first extreme often leads to great enlargement of the vocabulary and the verbal memory of the auditor but to only comparatively slight gain in his power of concrete discernment and judgment. On the other hand, educational method may go to the other extreme, providing merely internal knowledge, such as those imaginative recreations of works of art which are rhapsodic, diffuse, unsystematic, and emotive. This extreme may engender a pleasing mystic trance in the auditor and an illusion of widened experience. The auditor may be 'edified'. But actually he is likely to be no more enlightened than by a mirage. The ideal would seem to be a combination which avoids these extremes, e.g. a combination of exact external and imaginative aesthetic knowledge directed by some generalized method of analysis which secures system to this knowledge and trenchant applicability of it to particular works. This ideal seems possible only where historical scholarship and aesthetic power are united with and guided by philosophical insight into art, or insight into general principles. In the education of taste in the field of painting, Thomas Munro's *Great Pictures of Europe* and A. C. Barnes's *The Art in Painting* are examples of attempts in the direction of such an ideal.

It may be granted that education can widen and deepen the areas open to feeling and taste, and even that this is an important and necessary undertaking. But it may be objected that this will not change the inborn leanings and temperamental affinities which are the basis of taste. You cannot make a rosebush into an oak using the most fertile soil and the most skilful methods of cultivation. The answer is: quite true, you cannot. But often you can make a weak and runted rosebush into a very fine rosebush. And if education of taste begins early enough, it often can do likewise. Education of taste cannot delete the heredity of a person. But it can refine and expand inborn capacities. It can broaden and make more subtle both feeling and judgment. By bring-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ing feeling and judgment into contact with the whole orbit of value possibilities theoretically open to them in the arts, it can sharpen and clarify a person's unexamined scale of values. This enrichment of individual capacity is clearly a great gain judged by any humanistic standard. Nor is it unlike the best fruits of education in any other of its fields of endeavor.

Can education of taste in art do more than open the gateway to individual improvement? Probably not, so long as it operates within the early modern definition of taste. But if taste is defined as man's response to the total set of values in the arts, the case is somewhat different. Everyone is familiar with the distinction between instrumental and terminal values. In the area of instrumental values in fine art, education seems capable of developing taste 'objectively' as well as subjectively. Is this quiet color the proper material means for getting the melodramatic effect clearly aimed at in this painting? Is this loose organization the most appropriate formal means for making this painting an effective decorative constitutent of this tiny room? Endless questions of this instrumentalist type can be asked regarding the elements of each art, the elements of sculpture, architecture, music, motion picture, literature, the dance, as well as painting, and in each instance of each art. Here education can open a field for judgment which is not only immensely large and interesting and instructive, but in which inquiry can attain results of considerable exactitude widely verifiable by competent observers. Perhaps one should call such results judgments of technique rather than judgments of taste, since they are judgments of the adequacy of certain means to certain fairly well-defined ends. But this is, as I say, a question of definition. In one sense, they are judgments of taste. They are responses to an area of the total values in art, and express discrimination and feeling and choice. The chief difference between such responses and certain other responses to values in art is that these are immediately determined not by mere subjective satisfaction but by the adequacy of one objective element (color, organization) to serve as an instrument of another objective element (melodramatic effect, decorative effect) and independent of whether this second objective element is subjectively preferred or not.

As to terminal values, such as the intrinsic satisfactoriness of quiet color or loose organization, inquiry cannot attain and education cannot provide results as universally valid. It can supply here the widest possible basis for decision. It can illumine the relevant field vividly and provoke each person to the fullest self-examination. It can exert its great power of persuasion. But it cannot establish or divulge a set of terminal values in all cases identical for all persons or binding upon all persons, since terminal values are what an individual in his innermost individuality alone can fully approve. Education of taste in art has often seemed to ignore this. It has proceeded as if its business was to teach what everyone "should" like regardless of who he is. But this is to be false to the great personal quality of the arts. The arts are more than mere social products which reach to what is common among men. They are also personal expressions which reach to what is singular in each man. This truth should not be lost. At the same time, from a practical standpoint, there is more than mere dogmatism and error in an educative method which ignores without violently suppressing the individual differences of its clients, especially in the field of the arts. First, these individual differences are rampant and ineradicable, and will operate with the strength natural to them in judgments of terminal values in any case, unless a violence foreign to all sensible educational procedure is employed. Why underline the virulently obvious, particularly when the most precious part of the common values in the arts is so difficult to experience and so easy to overlook? Second, these individual differences are by definition subjective and private. Hence, the educative clarification of the arts is not properly concerned with their emphasis. Its chief topic is something else, viz., objects or works of art. Third, the extent of the common ground in the field of terminal values has never been determined and has no definitive limits at present. It may be, as I think it is, surprisingly large. Why not explore it without reservations, particularly since the chief reservation imposed by the diversity of human nature is obvious and will receive constant reiteration? Finally, whatever agreement in terminal values education is able to gain, whatever genuine similarity of approvals education can promote by free inquiry and discussion and an aspiration for human good, is a gain in human solidarity and brotherhood.

In summary, we may say that in the present day broad sense of the term taste, the education of taste, in the fine arts has three

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

objectives: (1) illumination of the properties of art and of works of fine art so that taste possesses the most ample and precise material for judgment, (2) instruction in the instrumental adequacies within this field of judgment, (3) promulgation within the ineradicable limits imposed by the individual differences of human beings of a set of common terminal values. —D.W.G.

**tatami** (Jap.). Straw mats, 3′ x 6′, and about 3″ thick, multiples of which are used to completely cover the floors of rooms in Japanese houses.

**Tatlinism.** See constructivism; RUSSIAN ARTS.

**tattoo.** The process of permanently marking the skin by pricking in pigment. Sometimes includes the producing of scars for decorative effects. See OCEANIA, THE ARTS OF; COSTUME ART.

**Ta-urt.** *Egypt. Relig.* Wife of Set; presided over birth of kings and gods and was an important figure in the underworld.

**tea ceremony.** See cha-no-yu.

**teaching art, methods of.** Procedures employed by teachers for guiding the various art experiences of pupils. (Methods are often characterized by the nature of pupil activity engaged in, such as *copy method, dictation method, free creative expression method;* certain art educators have devised methods of teaching which have been labelled so as to indicate their originators, for example, the *Dow* or *structure* method, the *Sargent* or *graphic vocabulary* method of teaching drawing, the *Ross* or *systematic* method of teaching design, the *Cezik* or *creative* expression method of stimulating pupil activity in the arts; other terms utilized to designate procedures of teaching art are *traditional, academic, art school,* or *studio, problem-solving, unit,* and *progressive* methods. Often several or all of these methods may be followed by an art teacher at various times and under various circumstances.) Whitford and Winslow in *Dictionary of Education.*

**tear drops.** The term is applied to globules of glaze on pottery which often appear near the base of a vessel in large tear-drop formation.
—J.A.M.

**teatra sacra.** See STAGESETTING.

**technique** (Gr. *technikos* fr, *technē,* an art). Expert method of executing the technical or mechanical details of an art. The most teachable aspect of an art, having to do with the development of skills in the manipulation of a given art medium, leading to virtuosity when exhaustively studied.

The development of technique in the arts is theoretically, but not practically separable from the development of expression. While facility in the use of a medium may be stressed in education and developed by practice, it can never be completely divorced from the character of an artistic statement. Thus, while virtuosity may be the theoretical aim of technical studies, "good technique" must be defined in practice as the ability to employ a medium adequately to achieve a predetermined expressive effect.
—L.D.L.

**technography.** Description of arts and crafts; the geographic study of the occurrence of technics such as weaving, ceramics, etc.

**techtiform.** Hut or house shaped.

**techtonic** (adj.). Pertaining to building or construction.

**telari.** See STAGESETTING.

**telamon.** A male figure used like a caryatid, as a supporting column.

**temmoku yaki** (Jap.). Pottery of black (or very dark brown) stoneware glaze due to the presence of iron oxide.

**tempera.** A generic term for any one of several paint media which leaves the surface of the finished product *matte* or without shiny reflections. Strictly speaking, egg is occasionally used for the same purpose, and once in a while someone attempts to use the albumen or white of the egg, but this results in a very brittle film which checks and cracks readily. If the yolk alone is used, a pliable, firm, and completely perma-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

nent film is formed with far less change of color or value than the layman would suppose possible, and complete permanence when permanent pigments are used. Acetic acid (vinegar) or formaldehyde may be used to preserve the medium while in use. Fig milk, honey, and various gums are used as tempera media, usually with other materials. The commonest modern tempera is glue (q.v.) (usually called *size* by artists). Ordinary skin glue is satisfactory, except for its tendency to swell when exposed to humidity or actual wet; casein glue is a newer development commercially, although it, too, goes back to the Middle Ages, at least for its origins. Used as a paint medium, casein is firmer but more difficult to manage than skin glue. See PAINTING; mural painting; also *Glue and Gelatin*, J. Alexander, 1923; *Animal Proteins, Bennett,* 1921, pp. 200-268; *The Materials of the Artist,* M. **temperament.** *Mus.* See ACOUSTICS.

**tempered glass.** See GLASS AND GLASSMAKING.

**emplate.** A slab or piece of material, as of stone or wood, placed under the end of a beam or girder to distribute the weight over a greater area.

**temple.** A building or structure set apart for the services of religious worship.

**temptation of St. Anthony.** According to the legend, St. Anthony of Egypt, who was born at Alexandria in the 3rd cent., went to live in the desert. During his hermit's life he was tormented by demons and tempted by women, but he overcame all peril by prayer. The subject, with its dramatic implications, was popular during the Middle Ages and the following periods, and has been treated many times. One of the most fantastic representations is the engraving by the German artist Martin Schongauer (1445-1491) in which St. Anthony is seen as he is lifted into the air by horrible demons. The most famous of all versions on the subject is the one by the German painter Matthias Grünewald in the Isenheim Altar in Colmar (Alsace) which he accomplished around 1515. The right inner wing of this gigantic altar piece shows, on the interior, how St. Anthony is tortured by evil spirits. The subject has recently been taken up in music by the German composer Paul Hindemith, who, inspired by Matthias Grünewald's work composed an opera called *Mathis der Maler* (Mathis the Painter) which he arranged as a symphony. One of the parts depicts the Temptation of St. Anthony. See *The Golden Legend* or Lives of the Saints as trans. by William Caxton, vol. II, pp. 224 ff., London, 1900; Anna Jameson, *Sacred and Legendary Art,* vol. II, pp. 724 ff., Boston and New York, 1895; Margaret E. Tabor, *The Saints in Art,* London, 1913, p. 7; Fitzroy Carrington, *Engravers and Etchers, Chicago,* 1917, pp. 30 and 32; Arthur Burkhard, *Matthias Grünewald,* Cambridge, Mass., 1936, pp. 37-39, plates 31-35.

**Tempyo art.** See JAPANESE ART.

**tenchi-kongen-m'yazukuri** (Jap.). See JAPANESE ART.

**Tendai sect.** See JAPANESE ART.

**tenebrists.** Painters of darkness; international group of painters of early 17th cent. inspired by the art of Michelangelo di Caravaggio (1565-1609). Characteristic is the use of violent contrasts of light and shade reminiscent of and often derived from conditions in basements or other rooms with artificial light. Most tenebrists preferred drastic and unidealized, occasionally even vulgar treatment of subject matter, religious, mythological or genre (q.v.) and therein opposed the idealizing academic painters of Bologna.

—R.B.

**tengai** (Jap.). The canopy often shown above a deity represented in painting or sculpture.

**tenjiku-yo** (Jap.). See JAPANESE ART.

**tenor.** See MEDIEVAL MUSIC.

**tenor banjo.** See MUSICAL INSTRUMENTS.

**tenor clarinet.** See MUSICAL INSTRUMENTS.

**tension.** (1) *Mus.* Considerable stress (higher than that provided by the general metrical conditions of a structure), brought upon a musical element through the context in which

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

it appears. More specifically applied to intervals and chords, the term *tension* designates their relatively high number of acoustical beats. See consonance. —E.K.

(2) *Dance. Tension* in movement implies force due to muscles acting against resistance. It depends upon the cooperative action of opposing muscle groups. This united action serves as a regulating device for controlling the amount of tension in the performance of motor activity. All types of movement depend upon it. Movements are strong or weak according to the amount of resistance present in their execution. It is only through proper tension that the muscles can adjust themselves to any desired intensity, or speed of execution, or the varying shades of artistic meaning. Muscle tension is the very basis of aesthetic experience and of expressive and communicative movement. The more *tensile* the movement, the deeper its physical power. Success in dance depends upon the dancer's ability to constantly readjust the proper balance between emotional demands and muscle tension. —M. N. H'D.

**tenson.** See MEDIEVAL MUSIC.

**Ten, The.** See POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U. S. A.

**Teotihuacan.** The name of the great ceremonial culture made in central Mexico prior to Aztec times but having its origin in the earlier Middle Cultures with influences coming from Vera Cruz. Late authors believe this culture to be the one of the semi-legendary Toltecs. —G.C.V.

**tepidarium** (L.). A warm room for a bath.

**tequitqui** (from Aztec word meaning tributary). Used in analogy with mudéjar (q.v.), (from Arab word meaning tributary) for Mexican Christian work with strong Indian character; usually the result of actual execution by Indian hands (intro. by J. Moreno Villa in *Escultura Colonial,* Mexico, 1942). **—J.Mc.**

**terrace.** A raised level space; natural or artificial.

**terra cotta sculpture, direct method.** Direct terra cotta sculpture can be made in three techniques: (1) The coil method; (2) the slab system; (3) the pottery wheel method. In building up sculpture in any of the three methods, the sculptural forms may be reduced to their simplest geometrical form. A head, e.g., could be formed from a clay cylinder, or two smaller cylinders superimposed on each other. A clothed female figure may be worked from a tall cylinder, a group of two figures from two cylinders, a reclining figure or an animal from a half-cylinder cut lengthwise. Or a seated figure can be formed by two half-cylinders (legs) and a full cylinder (body) over a cube (seat); a kneeling figure may consist of a large cylinder (body) and a shorter half cylinder (legs). After building up the mass of the group, it can be modelled in detail. Any variety of finish may be applied: tooling with wooden or wire tools; the application of small pieces of clay; or it may be smoothed. The latter has to be done most carefully. When the smooth piece is semi-dry, it may be burnished with a smooth tool to a light gloss, which it will retain after burning in the kiln.

For guidance in building up (in all three techniques) it is advisable to use a small sketch of the proposed figure; by measuring with calipers and multiplying these measurements in the chosen ratio, errors may be avoided.

Terra cotta sculpture should be made 10 p.c. to 12 p.c. larger than desired in the final stage to allow for shrinkage, depending on the type of clay used. Information on shrinkage ratios may be obtained from the clay dealer or by experiment. Clays of fine substance usually shrink more than those containing grog. The latter are esp. suitable for larger pieces, because of greater strength. Clay must be free of foreign matter, esp. plaster particles, as plaster will release gases during burning and may cause the piece to explode. Before starting to build, the moist clay must be well kneaded to remove air bubbles. During the entire process air holes should be avoided by pressing on the clay firmly, allowing the air to escape.

**The coil method** is used in sculpture of small to medium size: because of its simplicity it may be used successfully by pupils, amateurs and sculptors unfamiliar with ceramic sculpture.

One rolls out on a table long rolls of clay 3/8 inch to 1/2 inch thick, according to the size of the contemplated figure; these rolls should not be too wet, yet pliable. On a board, reinforced against warping, a coat of shellac is applied; when dry, one or more holes are drilled through the center of the board, inside of the bottom outline of the proposed sculpture. This outline is then

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

painted on the board with clay slip, which will cause the clay to adhere. The first coil is then laid along this outline. Subsequent coils are then laid on the first one; between each coil slip must be applied. As the piece develops, the outside as well as the inside have to be welded together by finger pressure so that hollows between coils are filled. During the process of building it is advisable to compare and measure constantly until the sketch may be discarded and the piece is finished. It is advantageous in direct terra cotta that the shape and form of the sculpture can be worked out from the outside as well as the inside. This results in a full, plastic form and, if carefully done, may elicinate in large measure any surface modelling. When the piece is built up completely, but still open on top, a plug of clay is pushed into the slip-treated opening. After finishing the sculpture, the highest part should be pierced in an inconspicuous spot (a knitting needle will do) to insure airflow while drying and burning. Terra cotta sculpture, like any ceramic product, must be absolutely dry for burning; any moisture remaining in the piece may cause its ruin in the fire. Drying should be gradual, not forced; it is advisable to lift the piece to allow passage of air so that it may dry evenly, as uneven drying may cause warping or cracks.

**The slab system** is preferable to the coil method in larger pieces and for quicker results, but proper construction, inside as well as outside, is the main problem in this technique. The larger the piece, the more it becomes an engineering construction problem, in which weight, pull and stress must be considered. For greater strength and to avoid cracking and warping, grog clay should be used. A small sketch or drawings of the design from all sides should be used as a guide. For the control of moisture (in any of the three methods of direct terra cotta) one may construct a permanent cover by nailing strips of wood together forming an open box, which then is covered with oilcloth, tacked over this frame. Damp rags (not wet) are used over the sculpture when evaporation of the clay becomes noticeable; in damp weather and while the clay is wet, covering with the oilcloth box is sufficient. A good sized board, 18 by 24 inches or larger, is covered with unbleached muslin. Two strips of wood 1/2-5/8 inch thick are laid on (or nailed) parallel, lengthwise to the board. The clay, after thorough kneading, is pounded well between the strips so that no airholes are formed. The surplus clay is then removed by running a straight, smooth strip of wood over the parallel strips until the clay surface is entirely smooth. The strips may then be removed from the clay slab, which then is allowed to dry for a few hours. When dry enough to allow handling, the clay is cut lengthwise into strips 3-6 inches wide; on the lower part of a figure wider strips may be used than on the higher parts. For large, flat surfaces, larger clay slabs may be used instead of strips (as in the plinth, or a cube-shaped seat or in parts of the inner construction). The first strip is carefully lifted from the muslin (which prevents sticking) and transferred to a narrow obard; this, in turn, is taken to the turntable on which the modelling board rests.

The modelling board should be strongly constructed and large enough to allow for air space or bulky rags between the sculpture and the oilcloth box. For large figures a board of double layers of wood, running crosswise, reinforced below by parallel strips, is screwed together so that warping will not occur. A few airholes may be drilled through the board in the center where the figure will stand. The board is then shellacked and when dry, the approximate outline of the sculpture is painted on broadly with thick slip. The clay strip is now laid along the outline, possibly around a curve or edge to prevent its falling over; when the next strip is attached to one end of the first one, it must be well pressed on. When the wall outline is completed and the first strip is firm enough, the second line of strips may be attached after covering the top of the first strip with slip. All seams must be eliminated by working the two strips together. As strips are set upon strips and the sculpture begins to rise, sustaining walls have to be built inside the piece. These inner walls should be carefully considered before starting the sculpture so that a maximum of strength may be obtained with a minimum amount of walls. They have to be pierced so that air may pass from one compartment to the other in drying and burning. In some cases one or the other wall may be eliminated when a buttress can supply enough strength. When a certain height is reached, 18 to 24 inches or more, a horizontal layer (pierced) may be established. It is obvious, that the inner walls must be well attached to the outer shape with slip and clay. As the piece rises to a height where weight becomes a factor it is good policy to allow the lower part to harden some-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

what, which will increase carrying strength. When the first section is completed the piece may be shaped from the inside and the outside. Curves in the construction are made by bending the strips after they have been put in place. Should the piece harden quicker than desired, it may be moistened with a wet sponge; this is important, as otherwise any added clay will not adhere firmly. Care should be taken to enlarge the piece as accurately as possible; it is well to stay within 1/4 inch or so of the final dimension of the surface. This 1/4 inch should be added when the piece is entirely built up, for the sculptural finish; as this outer skin is usually applied in small pieces under firm pressure, it will act as a protection against possible cracks in the more porous walls of the piece, which thereby seldom penetrate the surface. The openings on the highest parts of the figure should remain open as long as possible so that the inside of the piece may dry at the same rate as the outside; the openings are finally closed with a plug set in with slip. When the surface modelling is finished, the piece should be left to dry gradually but thoroughly. In large sculpture, transportation to the kiln must be considered; it is also well to know the size of the kiln beforehand. If possible, a large piece should be built close to the kiln; if the piece is too large to fit into a good sized kiln, it may be cut while moist, in places where the cut will show least. After burning the pieces can be cemented together. When cutting is foreseen from the start, it may be made less difficult by attaching the clay on the cutting line without slip or reinforcement and by marking the line on the outside. Cutting may be done with a knife, but the best method is the use of a twisted wire, in cutting the piece from the board before drying or in cutting any part of the piece.

**The pottery wheel method** is advisable only for sculptors familiar with the wheel or to those having the services of an experienced potter at the studio. This method is esp. suitable for decorative sculpture. Practically every part is thrown on the wheel, fitted together and modelled mainly from the inside out, requiring very little surface modelling. Accessories, such as hair, draperies, foliage, flowers, etc., are modelled in hand and then applied. Work of this type usually is glazed after the bisque firing and lends itself to unique effects, such as glazing in part only; the contrast between the unglazed parts (body) and the accessories in multicolored glazes is often very striking and decorative. Because of the rapidity of execution the relative frailty of this type of sculpture is no handicap, provided that the work is executed near the kiln, so that transportation is avoided.

Throwing clay on a wheel is not simple; a craft in itself, it requires years of practice. The clay to be used should be of fine grain and must be wetter than for modelling. It is centered on the turning pottery wheel and shaped by hand in the desired form; when sufficiently dry, it is cut from the wheel and transferred to the sculpture. Before starting, it is advisable to make full size drawings, from all directions, of the proposed figure; from these drawings the size and shape of the parts, to be thrown on the wheel, are determined. After the base is made by the slab or coil method, slender cylinders, thrown on the wheel are applied for the lower legs. Larger cylinders are used for the upper legs; a low, wide cylinder for the abdomen and a higher cylinder for the chest; a small cylinder forms the neck; and an oval shape is used for the head. Arms are formed similarly and hands and feet are made of flat forms, to which individual fingers and toes are fastened. While applying these pieces with slip, the form may be given by reaching into the hollow cylinders and pushing out the form or by pressure from the outside, starting from the lowest parts. As each piece is cut to fit and applied, it has to be braced by sticks pushed into clay balls on either end. As the piece hardens and shrinks, the braces have to be adjusted. Since the desired form is given each part as the piece is built up, the sculpture is almost finished after all parts are applied. Hair is made of clay rolls shaped into ringlets or strands and then applied; drapery is shaped from larger rolls. Leaves may be made by hand or pressed out of a mold made over a model leaf, etc. The thickness of all parts should not vary much; the larger piece should be sufficiently strong to carry itself and must be well balanced. This method is suitable for sculpture near life-size. Smaller figures may be constructed along the same principle, without the potter's wheel. In this case the various cylinders are made by shaping thin slabs of clay over rounded sticks of natural wood. When slightly hard, the cylinders are taken off the sticks, cut to fit and applied exactly as in the former method. —C.L.S.

**terra verde.** See green earth.

**tertiary colors.** See COLOR.

**tetrachord.** *Mus.* (1) A scale of 4 diatonic tones. (2) A four-stringed instrument.

**text.** *Book.* The body-matter of a book as distinct from the preliminary matter, etc.

**texture.** *Mus.* Term borrowed from the field of tactile experience, used in a figurative sense to describe the character which a musical structure has by virtue of the type of relationships prevailing particularly between its simultaneously presented elements (e.g. polyphonic t., homophonic t., compact t., transparent t., etc.) —E.K.

**tezontle.** Porous pumice-like red lava building stone of the Valley of Mexico.

**THEATRE** (Gr. showroom). The obvious and most striking characteristic of the theatre: the disparity of its sources and origins, the complexity of its contents and aspects, the variety of its manifestations and forms, indicates the quantity as well as the quality of the problems involved. An intricate composition of particular social, spiritual and psychological conditions, of customs and traditions, of subsidiary arts and contributive techniques, theatre is a collective phenomenon in foundation and principles, structure and form, i.e. the concept theatre comprises a multitude of subordinated or coördinated phenomena of essentially different nature and order. As compared to other arts, which are determined by material and aesthetic data of one single category, it is the distinctive criterion of the theatre to achieve a coherent artistic unity out of numerous constituents of divergent natures. This ultimate achievement, however, can but partly be preserved in lasting evidence. In fact, as soon as the specific theatrical creation is completed it ceases to exist as such; a process which reveals the ephemeral and illusionary quality of the theatre art-work.

Therefore any productive estimation of the theatre depends on the basic notion that this particular quality of fugitive illusion, in whatever scenic representation of play and drama, is actually the theatre's form of reality, finality and completion. Theatrical reality is not conditioned upon its relation to objective, concrete appearance in space, nor on its measurable duration in time, but on the participants' spontaneous or deliberate acceptance of its specific validity. Many discrepancies in dramatic and theatric theory can thus be explained. The conflicting views with regard to this condition are mainly due to the antagonistic directions of artistic endeavor: one tended toward unrealistic fantasy, the other directed toward naturalistic resemblance. However, if the scenic reality is to have artistic relevance, such relevance depends solely upon the degree of genuine theatric perfection, not on the exactitude, probability or truthfulness obtained in one direction, nor on the quantitative effort of imagination expended in the other.

Theatre originates as well as culminates in the transient instants of the actual performance, the vital centre of which is, or at least ought to be, the actor. Nevertheless the creation of the actor, however dramatic the scenic situation, would be incomplete, if not impossible, but for the active and reactive participation of the audience. For the audience is an integral part of the theatrical process proper; between performers and spectators exist functional relations which create suspense and tension not originally resident in the presented subject. Although the position or opposition of performer and public in space have significance beyond the practical requirements of providing favorable visual and auditory conditions, any scene or decoration or architecture supporting and surrounding the performance is merely accessory, however important or artistic in itself. The predominance of overwhelming scenic display and sumptuous architecture during certain periods, in particular the Baroque, substantiates this often ignored principle.

It is also obvious that literary evidence, as contained in a dramatic text, cannot convey an accurate idea of the eventual scenic interpretation—the latter being an accomplished creative act in itself. Incidentally this condition points towards the peculiar and suggestive problem that a work of art which already constitutes an ordered artistic whole becomes the material of yet another creative process, aesthetically valid in its own right. As a legitimate artistic category, however, theatre can be directly appreciated, independent of any literary consideration. The production of literary drama in terms and with means of the theatre is a genuine artistic creation, and in no way a re-production. Consequently, despite the intrinsic interdependence, the aesthetic validity of literary drama does not depend on its actual realization on the stage; nor does a perfect scenic or histrionic performance imply literary substance of any avail. Originally the concepts of theatre and drama refer to but one phenomenon. In fact, the primitive form of drama is at the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

same time a rudimentary form of theatre, thus disclosing the original identity of this source.

Theatre and drama arise from early ritual. This moment marks a highly significant attempt at intentional, formal expression of primitive man, in direct emotional response to the unfathomable, fear- and awe-inspiring mysteries of nature. At all times and with all peoples, giving suggestive evidence of universality, these initial performances originate spontaneously in a collective emotion. Almost generally assuming the form of either pantomimic or ecstatic dance, these spectacles tend to prove that man possesses innate mimetic and rhythmic dispositions. Indeed, the impulse to act as well as the instinct to release physical or emotional tension in rhythmical movement antedates any permanent record of art. At this early stage of civilization the language of tangible images and material symbols is far more developed and differentiated than speech. Thus visible effigies and representative performers stand for phenomena yet beyond the grasp of human mind, or else for facts, things and experiences yet beyond the capacity of abstracted expression. Also the inadequacy of spoken language appears compensated by an extraordinary expressiveness of the bodily language.

However considerable at times the incidental aesthetical benefit, these first dramatic manifestations of creative mind are but instrumentally relevant, i.e. as means for the attainment of real and vital ends. Notwithstanding the metaphysical principle implied in worship of spirits, deities, demons and personified cosmic or physical phenomena, the primitive ritual emphasizes practical rather than spiritual issues, such as the quest for rain or game, the conjuration of plagues and disasters, etc. For this material reason no categorical distinction can yet be made between the performance of ritual proper and secular ceremonies bearing upon war, labor, hunting, birth and death, mating, initiation, etc., or even the formal routine of collectively organized pleasure and play.

The subsequent differentiation is not due to a conscious, cognitive act: it is rather an instinctive, twofold expression of the latent dualism between material and spiritual tendencies. And although they grow eventually apart, visual and visionary world still hold an identical quality of magic and fascination. This becomes particularly evident in the important rites related to natural production and fertiliy. They contribute a great variety of subjects and forms, covering the whole range from strict rites and solemn ceremonies, through orgiastic pageants, to frankly erotical and phallic symbolism. Although the profane tendency shows unmistakably in ostensible exaggerations, comical imitations and vulgar or burlesque allusions, the majority of these performances discloses nevertheless the characteristics of their metaphysical origin. The performers, however drastic in suggestions and expressions, feel themselves as integral parts of an inspired collective or participants in a sacred service. On the other side, the practice in dealing with fearsome superhuman forces or religious mysteries requiring knowledge and involving responsibilities beyond the scope of ordinary man, it often develops into the exclusive and esoteric office of privileged representatives: medicine man, sorcerer or priest. Supposed to be endowed with mysterious qualities they assume frequently the authority of professionals who may virtually be considered as actors.

The gradual transition from these various ceremonies to genuine drama and theatre is indicated in the significant process that dance yields its dominant position to the medium of speech. Indeed, the human experience that urges and desires, emotions, thoughts and feelings are communicable must be considered a revelation of immeasurable consequence. No longer restrained by the bodily limitations of mere physical expression, man avidly grasps and develops the almost unlimited power to convey something on the strength of spiritual effort. Thus the circle of subjects widens considerably, comprising the spontaneous narration of actual incidents and events as well as the more involved accounts of mythological and historical legends. Often the components of these simple tales already hold potential dramatic tension, i.e. a latent antagonism between opposed persons, groups or tendencies. This ever possible conflict, presented so as to form a consistent plot or story, is the very essence of drama, wether visually enacted or spiritually sublimated in poetry.

Gradually the repetition and recurrence of typical performances leads to regular and increasingly strict and ingenious conventions and traditions, with dance providing physical pattern and spatial organization, i.e. structural principles for the development of artistic form. It would be conjectural though, to determine to what extent the impressive formal stylization in so-called 'primitive art', in particular as manifested in theatrical forms and attributes: masks, costumes, make-up,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pantomine, dance practice, etc., denote an original artistic quality or rather one inferred by subsequent aesthetic evaluation. The formal perfection and expressive power of theatrical masks—e.g., in the primitive ceremonial, in the ancient Greek and Roman theatre, in the performances of the Far East—may easily lead to the conclusion that they represent ends, intentionally artistic in themselves, and which are meant to be appreciated as such. However, originally they are rather scenic means, instrumental in portraying or emphasizing dramatic characters, moreover without reference to their consistency with the actor's individual capacity of interpretation or transformation.

As long as the actor wears a mask—whether it be modelled in some plastic material or painted on with heavy make-up—he is virtually an anonymous representative: his every distinctive feature points toward the accomplishment of a stylized type or character, established and admitted in advance. Subsequently this practice leads to the fixation of rigid, permanent 'stock characters', a theatrical tradition which covers the greater part of theatre history and can yet be traced in the present theatre. Stock characters dominate the ancient Greek and Roman theatre; they flourish magnificently in the Italian improvised comedy (***commedia dell'arte***), from where they spread over the European world, clearly manifest in the comedies of Gozzi, Goldoni and Molière; they are still alive on the Chinese and Japanese stage; they persist universally in the traditions of puppet- and marionette-plays.

As a specific form of histrionic characterization **stock characters** are in current usage on the lowest level of public performances, serving the purpose of easy appreciation for an unpretentious or uncultured audience. In the other extreme the typified characters bring to visual life the imaginary or allegorical or superhuman symbols of a homogeneous collective emotion or conception. As such they can but be conceived in a compact religious, social or ethnic unity, as e.g. in ancient Egypt and Greece, in China and Japan. Only with the differentiation, or even disintegration, of later social organisms individual traits, and finally psychological interpretations, appear in histrionism.

In the early stages of theatre history the solution of the various aesthetical and practical problems is simple and automatic. There is no conflict as yet between spiritual or emotional contents and their adequate expression, since only that is expressed which is actually experienced or only experienced that which can be adequately expressed. As long as the performance deals with subjects which are indiscriminately known to the whole assistance, performers and spectators are either identical or interchangeable or they meet on the same plane. But once the performance enters the sphere of imagination or abstraction invisible barriers first, tangible ones later, separate the initiated actors from the mere audience. At some moment during this evolution the medicine man or priest will seize the prerogative of playing, leading or directing an activity, the suggestive power of which serves his spiritual purposes, and not rarely his practical ones as well. Yet outside the realm of sacred ceremonial arises irresistably an elementary urge to play and act, directly and successfully appealing to the lower instincts of the masses. And henceforth exists a perpetual, open rivalry between the church (in the broadest sense) and popular entertainment.

In chronological or genetical order the ritual precedes any other definite form of beginning theatre, a principle which is again repeated whenever the continuity of evolution has been interrupted. Of the theatrical activities in the oldest civilizations many dramatic and literary documents have been preserved, but comparatively few reliable, specifically theatrical data are available. In particular with reference to the **Egyptian theatre** the specific knowledge is limited. Owing to modern research and recent authoritative investigation there were several forms of actually enacted drama (the resurrection plays and the 'Coronation Festival Plays', roughly two centuries before the well-known document of an 'Osiris Passion Play' of 2000 B.C., an activity continuing up to the beginning of the Christian era. Presumably played and directed by the priesthood these dramatic ceremonies were performed in "regularily appointed places"; sculptured masks have been in use. There are no substantial indications as to the **Hebrew theatre**, although the recorded forms of dramtic poetry may lead to such an assumption, and although the Bible frequeutly refers to dance and ceremonial. But the very principle of imagery and theatrical representation was contrary to the Hebrew creed; there were most certainly no theatres in Judea.

The **Hindu theatre** has a well established theatrical tradition. The early period, strictly

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

religious in its origins, is lost in the dark. While there exists a flourishing, highly poetic Hindu drama, the plays are nevertheless not truly dramatic to our Western comprehension; subjects, language and representations are a refined art, requiring a high level of culture and education from both actors and spectators. Consequently the theatre, in this exclusive form, never became a wide-ranging, popular art; nor was there a necessity for special theatre buildings or stage settings. The modern theatre, under Western influences, has little distinctive character or importance. The **Javanese theatre** is literally related to the Hindu drama. It develops, however, in a curiously independent way which has no analogy whatsoever in the entire history of the theatre. It originates in the shadow-play, which leads to puppet- or marionette-plays, and further to living actors who imitate in costume, make-up and gesture the model of their artificial ancestors. Only lately independent living actors appeared on the stage. The actors are mute; their text is spoken by a reciter. Owing to the immense popularity of the Javanese theatre play houses are built all over the country. The Javanese theatre presents an extraordinary phenomenon which can be correctly and fully appreciated only upon careful analysis.

As a specific art form the **Chinese theatre** is by far the richest and most consistently developed. The literary drama, not prominent in itself, is almost meaningless for any but Eastern appreciation. Although the high standard of the theatrical art is objectively evident its intricate symbolism is scenic traditions, practised and perfected for hundreds of years, is lost to the uninitiated, and we have no means of approach to the significance of the exceedingly strict scenic and histrionic traditions. The very simple scheme of the unchangeable stage, a number of stylized properties and even the plays or dramas themselves, remain merely accesory; it is in the art of the actor alone that the Chinese theatre is represented. His artistic means are conventional, from the wearing of magnificent costumes, to the implications of his every step, movement and gesture; his interpretation is limited to unvarying stock characters which are indicated with mask-like, symbolical make-up, derived from original masks. Yet within these limitations the histrionic art develops consciously and purposefully to still valid, unequaled height of final, formalized expressiveness and utmost artistic completeness. There are many common features between Chinese and **Japanese theatre**, the latter being imported from China by way of Korea. Two forms of theatre can be clearly distinguished: *No* and *Kabuki*, and an additional, very popular puppet theatre. Originating in the ritual, the *No* play is intellectual, refined and aristocratic, with only the slightest suggestion of a truly dramatic text. The *No* is not popular and not meant to be so. Again, the highly formalized style of the representation and the esoteric associations in word and gesture evoked to the initiated, completely escape our appreciation. There are but few actors in one play; their movements are strictly regulated and formally prescribed; they are impersonal representatives and wear masks. The stage is extremely simple; the only purely decorative element is displayed in the richness of the costumes. This old and noble tradition has been carried on faithfully for over 600 years and is still unchangeably valid. The popular theatre, *'Kabuki'*, is much younger and, although secular in dramatic substance, it owes most of its formalism and pantomimic customs to the *No* form. Although no mask is used the make-up still reminds of the mask tradition. The stage however is more elaborate; in 1758 the revolving stage is introduced. In principle any survey of the Oriental theatre, whether thus brief or more explicit, will have to suffer from the fact that our understanding of its innumerable, rich and beautiful manisfestations is limited to mere aesthetical appreciation. Thus the present *No* seems far more remote than the farthest vestiges of the Western theatre world.

The theatre of all Western civilizations is inextricably determined by the powerful stimuli of the **ancient Greek theatre**, the unequaled beauty and harmony of which for long centuries set the standard of perfection for the entire theatre complex: drama, playhouse, histrionism and theory. Thus in literature the serious drama is under the overwhelming impression of the gigantic Greek tragedies; the dramatic theory of generations to come depended on the rules of this drama and its theorists. In the field of architecture and scenic settings innumerable formal solutions evidence the respective interpretation or mis-interpretation of the Greek scheme of stage and auditorium. And in the essentially histrionic activity the elementary impulses for true, mimetic expression are released and stimulated.

Once again this theatre originates in sacred ceremonial: the worship of Dionysus, the god of wine and fruitfulness, the great creative

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

power which embraces the spiritual as well as the material and sensual world. At the very beginning are already revealed the two directions of human aspirations, one eventually leading to the tragedy, the other to the comedy and the Satyr-play. The unordered mass of worshippers is soon grouped and organized by a leader, and particularily gifted individuals find an opportunity to detach themselves from the performing group or 'chorus', up till then the centre of the performance and later an integrant part of it. The first who achieved this decisive innovation was Thespis (in 535 B.C.) who probably also introduced the mask. Aeschylus added the second actor, Sophocles the third; thus they created a visual opposition equivalent to the spiritual one and transposed the latent dramatic conflict in the tangible representation of tragedy.

The immediate tradition, however, does not follow the sublime ways of the tragedy, but is rather perpetuated on a considerably lower level by the actors of the comedy and the burlesque Satyr-players, by the comedians of the Roman *mimi* and *atellanae,* all of which are popular comedies or farces with simple plots and stock characters. Here generate the very ancestors of innumerable successive generations of those ever popular actors who fill not only the popular stages, but streets, markets and meeting places, who amuse and entertain the broad masses of populace, who constantly and successfully rival with the serious, elevated, literary theatre. The most important and coherent period of these actors is the era of the commedia dell'arte, the comedy of improvisation powerfully thriving in the 15th and 16th centuries. The force of their improvisations, besides true histrionic genius, is the very simplicity of their plays and plots, the transparency of their characterizations and the easy adaptability to the responsiveness of the varying audiences. Moreover they renounce on the commodities of an elaborate stage or scenic display and technical devices and are thus ever ready to start on the spur of the moment. It always was, and still is, hard for the literary theatre to compete with the spontaneity of such elementary histrionism.

The great contributions to the theatre during the Renaissance, with the revival of the ancient Greek and later Roman theatre, and the Baroque, the sumptuous scenic display of which surrounded magnificent operas or ballets or insignificant dramatic substance, are specially dealt with (see DRAMA; OPERA; STAGESETTING). One significant event, however, must be mentioned here, although it left no literary or histrionic or even decorative heritage: it is the spontaneous generation of a specific form of theatre in the Middle Ages. The center of this theatre is the Christian ritual. The first sacred dialogues and scenes, enacted by priests within the church, were so successful that they soon outgrew this restricted circle of action, to be transferred on the steps of the church or some public square. Although other sacred subjects are recorded, the main tale of these religious plays, called mystery plays, was the passion of Christ. Innumerable such mystery plays can be traced throughout the 15th, 16th and 17th cents. all over Europe and England. They are wholly undramatic, but highly suggestive and imaginative. Conceived for and played by the entire community they comprise huge masses, either as players or as spectators. There was no stagesetting in the usual sense; but since numerous scenic situations or mansions had to be suggested, the mystery play developed a unique and very characteristic form of simultaneous scene, i.e., of places arranged simultaneously one next to the other. They were often decorated with care and drastic realism. The organization of these giant plays, sometimes lasting for several consecutive days, indicates the great skill of the clerical directors and producers. Yet, despite their wide range of influence, the mystery plays disappear almost and leave no direct traces whatsoever in either the contemporary or the later theatre. Only the "Confrèrerie de la Passion", a group of professional mystery-players, survived, owing to official support and privileges. United with Molière's "troupe" they found (1680) the "Comédie Française" in Paris.

With Shakespeare's dramas and comedies a new specific problem is introduced into the theatre, independent of the flourishing contemporary court theatre. The representation of a Shakespearean play requires first: actors, capable of differentiated individual characterization; secondly: a stage, suitable for frequent and quick shifting of the scene. The first requirement is soon, and badly, realized: English comedians go on tour on the continent, inaugurating an era of effective, but cheap, drastic, realistic play practice. And although the Elizabethan popular stage must have served its purpose, the second requirement was elsewhere not realized at all. Thus the greatest, genuine theatrical genius fades out of the world of the theatre for several

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

centuries. But again, when he is finally rediscovered and made available in continental translation (in the late 18th cent.), the performance is met with the same two problems. However, in the meanwhile the actor has developed a far more refined art, and soon some prominent ones excel particularly in Shakespearean rôles. Yet, the scenic solution is inseparable from the actor's play. Some remarkable, so-called "Shakespeare-Theatres", accomplish more or less successfully an adaptation of the Elizabethan scheme to modern conditions, fully aware of the actor's predominant position. Up to this day there are almost as many attempted solutions as there are imaginative men at work in the theatre. Indeed, such never ending, fascinating challenge to ever better achievement preserves the theatre from stagnation.

Fundamentally new, and still essentially valid, problems enter the theatre through the medium of the naturalistic dramatic tendencies. Now the actor is to interpret characters conceived not in the sphere of imagination and artistic abstraction, but rather in the psychological climate of human completeness and verity. While, on one side, he is thus led to an overemphasis of merely descriptive detail, he acquires on the other a sensitiveness and nervousness which indicates the temporary break with the ancient mimetic tradition. The conflict is inevitable: any excess of realistic accuracy stresses the incompatibility between the almost-perfection of mere copy and the unrealistic quality of the scenic art. The capacity of physical imitation is, indeed, the very reverse of the histrionic principle. For the object of imitative characterization is reality: its ideal achievement is perfect deception; whereas the object of histrionic characterization is an artistic creation: its ideal achievement is artistic truth.

The concept *theatre* is complex and collective. An intricate composition of particular ethnic and social, spiritual and psychological conditions, of customs, institutions and traditions, of subsidiary arts and contributive crafts, the theatre is determined by a specific process of integration of all or any number of different constituents. This accounts for the infinite variety of position, function and significance of theatrical phenomena, forms and expressions within the cultural pattern of human societies. In aesthetic appreciation it appears as the distinctive characteristic of the theatre to achieve a coherent artistic unity out of numerous elements of divergent nature and order. This ultimate achievement, however, can but partly be preserved in lasting evidence. In fact the ephemeral character of the theatre art work is its specific form of finality and artistic completion. For any theatrical creation is valid and significant in progress only, i.e. in the chronological sequence of those transient instants which compose a continuous dramatic action. These fugitive moments, and only these, yield full and authentic aesthetical information.

The obvious and most striking characteristic of the theatre: the disparity of its sources and origins, the complexity of its contents and aspects, the variety of its manifestations and forms, indicates the quantity as well as the quality of the problems involved. It accounts primarily for the fact that the growing importance of accessory circumstances tends, and sometimes achieves, to obliterate the central figure of the theatre: the performer, be he dancer, mimic, actor or singer. Thus the splendor of the late Renaissance court festivals and the overwhelming scenic display of the Baroque theatre left a great heritage in state design, costume drawings and architectural documents, but only scarce and fragmentary choreographic or histrionic records. Moreover the creation of the performer—however important his individual interpretation or however dramatic the scenic situation—would be incomplete, if not impossible, but for the active and reactive participation of an audience. For the audience is an integral part of the theatrical process proper; between performers and spectators exist functional relations which create suspense and tension not originally or not necessarily resident in the presented subject. Although the position or opposition of performer and public in space has significance beyond the practical requirements of providing favorable visual and auditory conditions, any decorations, scene or architecture supporting and surrounding the performance is merely accessory, even though often artistically relevant in itself. The mise-en-scène and the various artistic elements it is composed of have no intrinsic aesthetical justification; and they give but incomplete information on the theatrical accomplishment.

For the same reasons literary evidence, as contained in a dramatic text or musical evidence, as contained in a score, cannot convey an accurate idea of the eventual scenic interpretation—the latter being a completed crative act in itself. Incidentally this condition points towards the peculiar and consequential problem that a work of art which already constitutes an ordered artistic whole

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

becomes the material of yet another creative process, artistically valid in its own right. As a legitimate artistic category, however, theatre can and must be directly appreciated, independent of any literary or musical consideration. The production of a literary drama or a musical one in terms and with means of the theatre is a genuine artistic creation, and in no way a re-production. Despite the evident interdependence between subject matter and interpretation the validity of a literary drama or an operatic composition does not depend on their actual realization on the stage; nor does a perfect scenic performance imply literary or musical substance of any avail.

Originally the concepts of theatre and drama, danced, enacted, spoken or sung refer to but one and the same phenomenon. In fact the primitive forms of drama are at the same time rudimentary forms of theatre, thus disclosing the identity of their source. The origins of theatre-drama can be identified with those of early ritual. This holds true not only to the extent that both theatre and ritual are integral parts of a homogenous culture characteristic for a given time or people; beyond any such generalization both manifest identical elements in their origins and identical principles in their interpretation. At all times and with all peoples, giving suggestive evidence of universality, these initial spectacles originate spontaneously in a collective emotion, in direct response to the unfathomable, fear- and awe-inspiring mysteries of nature. And almost generally they soon assume the form of either pantomimic or ecstatic dance. As exhibition of a single individual or as ordered group movement, dance unfolds visibly that curious and complex urge to creative self-realization which precedes and also pervades the organized theatrical activities of developed societies. Regardless of various degrees of artistry and elaboration all of these dance spectacles tend to prove that man possesses innate mimetic and rhythmic dispositions. Indeed the impulse to act as well as the urgency to release physical or emotional tension in rhythmical movement antedates any permanent record of art.

At this early stage of civilization the language of tangible images and material symbols is far more developed and differentiated than speech. Thus visible effigies and representative performers stand for phenomena yet beyond the grasp of human comprehension, or eles for facts, observations and experiences yet beyond the capacity of abstracted expression. It also appears that the inadequacy of the spoken language is largely compensated by an extraordinary eloquence of the bodily language, far beyond its usefulness to procure physical symbols for inarticulate or inadequate speech. This language of gestures, at first wholly spontaneous, purely functional or merely useful, gradually develops into an involved system of combined technique and meaning, increasingly independent of primitive impulses or physical necessities. A striking example thereof offers the oriental theatre which developed an immense body of codified gestures and rigid play conventions. Sublimely beautiful, dispassionate and detached the oriental theatre does not permit of spontaneous improvisations, subjective interpretations or the exhibition of individual emotions. Unlike our occidental theatre experience, the pleasure both for the actor and the spectator is derived not from the moments of surprise and suspension, but from the satisfaction of being initiated; not from the immediate impact of strong passions, but from the appreciation of a perfectly controlled play of harmoniously balanced emotions. This tradition has become so integral a part of the entire cultural set-up that it stands, as it may decline, with it. In the western cultures only lately the complex meaning or symbolic signification of gestures has been critically evaluated; quite recently it has been applied purposely in modern dance and, in a less consistent way, in modern acting. However, certain codes and traditions of gestures can be traced almost everywhere; in various forms of ecclesiastical or court ceremonial, in many histrionic conventions, as well as in numeruos minor formal practices down to the curtsey and other social customs.

Despite many obvious discrepancies there appears a repetition of expressive forms and means or a correspondence in the evolution to such forms and means which permit of a schematically valid pattern of the world theatre. In the beginning ritual-dance or ritual-theatre are but instrumentally relevant, i.e. as means for the attainment of real and vital ends. And notwithstanding the metaphysical principle implied in worship of deities, spirits, demons and personified cosmic or physical phenomena, the primitive ritual emphasizes practical rather than spiritual issues; no categorical distinction can yet be made between the performance of ritual and proper secular ceremonies or even the formal routine of organized pleasure and play. The subsequent differentiation is not due to a conscious, cognitive act; it is rather an instinc-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tive, twofold expression of the latent dualism between material and spiritual tendencies. And when eventually they grow apart, visual and visionary world still hold on identical quality of magic and fascination. This becomes particularly evident in the important rites related to the generative powers of nature. Contributing a great variety of subjects and forms they cover a wide range, from strict ritual and solemn ceremonies, through orgiastic pageants, to phallic symbolism and frankly erotical performances. Although the profane tendency often shows in ostensible exaggerations, comical imitations and vulgar or burlesque allusions, the majority of these performances discloses nevertheless the characteristics of a metaphysical origin.

The performers, however drastic in suggestions and expressions, feel themseves as integral parts of an inspired collective or as participants in a sacred service. On the other side, the practice in dealing with fearsome superhuman forces or religious mysteries requiring knowledge and involving responsibilities beyond the scope of ordinary man, it often develops into the exclusive and esoteric office of privileged representatives: medicine man, magician, sorcerer or priest. Supposed to be endowed with mysterious qualities they assume high authority and frequently the rank of accomplished professionals in acting and experts in directing and choreography.

The gradual transition from these various ceremonies to genuine theatre-drama parallels the significant process of dance expression yielding its dominant position to the medium of speech. Indeed the human experience that urges and desires, motions, thoughts and feelings are thus communicable must be considered a revelation of immeasurable consequence. No longer restrained by the physical limitations of bodily expression and symbolic language, man avidly grasps and develops the potentialities and almost unlimited means to convey something on the strength of essentially spiritual effort. This new power of communication of the non-visible or the non-present breaks the boundaries of time and space, appropriates the past and future and the dimension of imagination. Consequently the circle presented subjects widens considerably, from the simple form of spontaneous narration of actual incidents and events, through the primitive and oriental theatre has been or historical legends, to real hopes, wishes and formulated expectations, and eventally to pure abstractions. Often the components of these tales already hold potential dramatic tension, i.e., a latent antagonism between opposed persons, groups or tendencies. This ever possible conflict, presented so as to form a consistent plot or story, is the very essence of drama, whether visually enacted or spiritually sublimated in poetry.

It should be borne in mind, however, that representations essentially without speech, like dance, dance-drama and pantomine constitute primitive forms of the theatre only with reference to a strictly genetical order: regarding their artistic significance they may, and often do, represent the highest conceivable form of artistic accomplishment. This again applies particularly to the evaluation of tribal dance and oriental performances. In a generic appreciation the almost complete absence of intrinsically relevant dramatic literature—if dramatic at all—in primitive cultures or in the Orient as compared to the volume and consequence of dramatic literature in the Occident tends to further confuse the theatrical issue. Latest in every theatre history, the literary drama is but one of several specific forms of dramatic expression all of which are equally genuine and legitimate branches of the theatre complex. Music also parallels the evolution of the theatre, from the simple beating of time, the regular reiteration of sounds, rhythmic songs and monophonic tunes, to elaborate polyphonic accompaniment, symphonic compositions and musical drama (see opera). Although a special survey is beyond the scope of this study the increasing importance of music for the development of dance (q.v.) and any but the literary drama (q.v.) is duly emphasized.

Gradually the periodical repetition and seasonal recurrence of typical performances leads to regular and increasingly strict and ingenious conventions and traditions, with dance providing physical pattern, spatial organization and harmonious rhythm, i.e. structural elements for the development of artistic form. It would be conjectural though to determine to what extent the formal stylization in so-called 'primitive' art, as manifested in theatrical expressions and attributes: masks, costumes, make-up, dance steps, dance gestures, etc., denotes an intrinsic artistic quality or rather one inferred by subsequent aesthetic evaluation. So far our appreciation of any historical and foreign, and in particular of historical and foreign, and in particular of the primitive and oriental theatre has been largely determined by and expressed in terms of an aesthetic experience. Of necessity this approach not only lacks the spontaneousness

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and immediacy of response which is so essentially theatric, but also the all-inclusive completeness of understanding which is determined by the material circumstance of participation; the immediate reference to actuality, directly and strongly appealing to the contemporaries or active witnesses, is irremediably lost to later generations or detached investigators. The complex of material evidence preserved and handed down as thatrical 'form' is not only an aesthetic expression of specific dramatic contents, but just as much a function of the respective social circumstances, and often not more than accidental solution conditioned by technical facilities or concessions. These simple considerations may account for the manifest failure of various attempts at literally reviving, in substance and form, e.g. the Antique festivals, the Mystery plays, the Elizabethan stage or the ceremonies of primitive peoples.

Outside our well defined cultural circle we cannot rely on an objective test of authenticity for the appreciation of theatrical art and activity. Any theatrical creation, inasmuch as it corresponds to the particular cultural set-up wherein it occurs, carries its very own justification. For example the formal perfection and expressive power of theatrical masks may easily lead to the conclusion that they represent ends intentianlly artistic in themselves, and which are meant to be appreciated as such. However originally they are conceived merely as scenic means, instrumental in portraying or emphasizing dramatic characters—for an audience which comprehends the immediate meaning and implication rather than the abstracted quality of artistic significance. Yet beyond any such usefulness, the universally recognized validity of the mask tends to prove that it is more than an ever fascinating accessory: the theatrical symbol of an anthropological principle. Thus it can safely be assumed that a thorough analysis of its origins and forms and varying significance will yield invaluable information toward the understanding of the origins and the psychological implications of theatrical phenomena in general.

Originally not the mask, but its wearer is the accessory, although the terrifying potentialities of the symbol may eventually be identified with himself. Feeling himself distinguished through the inherent power of the symbol, though arbitrarily vested with, the wearer often develops, mystically or rationally, the distinctive personality that adequately fills the given form. This holds particularly true for the representation of divine, imaginary, legendary or allegorical characters. Such symbolic validity can but be conceived in complete religious, social or ethnic integration, as e.g., in ancient Egypt and Greece, in China and Japan, in primitive cultures. But, more generally, whenever it appears first the mask stands in its own right, without necessary reference to the wearer and his individual capacity of interpretation or transformation. As long as the actor wears a mask—whether carved in wood, modelled in plastic material or painted on with heavy make-up—he remains virtually anonymous, his every distinctive feature pointing towards the accomplishment of a stylized symbol, type or character established and admitted in advance.

The continuance of this practice explains the eventual fixation of rigid, permanent characters: 'stock-characters', representing generalized human traits, features or types. By their very form of summary characterization they determine a simple form of drama, requiring little, if any, literaty substance and only the merest suggestion of costume, stage and decoration. Serving the purpose of easy appreciation for an unpretentious or uncultured audience, they are typical for all forms of popular entertainment. And regardless of the theatre's constantly varying poetic climates and scenic surroundings they are faithfully preserved and transmitted from one generation to another. Sometimes they also seem to generate spontaneously; for there are many instances when they appear without any possible or provable direct contact or chronological sequence. Thus stock-characters dominate the ancient Greek and Roman comedies; they flourish magnificently in the Commedia dell' Arte, whence they spread over the whole Western world, clearly manifest also in the comedies of Gozzi, Goldoni and Molière; they persist universally in the tradition of the puppet- and marionette-play; and they can yet be recognized on the contemporary stage.

Mask and stock-characters begin to disappear with the progress of the literary drama which opens a new histrionic era by introducing individual instead of typical characters into the theatre. As histrionic conceptions the two are mutually exclusive. The stock-character, on one side, is originally appreciated for the very condensation and stylization which prevents it from representing a dramatic character as a consistent, if not human, totality. Assembled in a cumulative process it is a schematic personage with virtually the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

same position and function in every dramatic constellation. It should be remembered though that in a later stage of evolution in the occidental theatre their number attained up to several hundred varieties, thereby demonstrating a symptomatic tendency toward individual discrimination. On the other side the truly individual character, as conceived by a dramatist, is not just another variation of a standard type, but a genuine creation, valid only with reference to one specific and unique drama. This condition, however, does not imply that there is but one possible, ideally 'correct' interpretation for each role. It mainly indicates a fundamental change in the histrionic attitude.

In historical perspective the change does not appear as radical as in fact it is, because it is far less obvious in the dramatic literature which is wholly preserved than in the histrionic achievement which is wholly lost. However, regarding the histrionic potentialities the artistic relevance of the drama itself is of secondary importance, for the actor is not concerned with the intrinsic quality of the dramatic subject matter, nor with the literary merit of the art work. The absolute standard of his art depends on his individual vision and accomplishment rather than on the dramatist's. More generally all histrionic efforts and energies are merely means toward a definite final effect: the direct impact upon a receptive mass. The immediate response of the audience is an infallible, in fact the only, test for the actor's achievement or failure; even though such spontaneous mass judgment is forcibly subject to endless subsequent revisions.

Notoriously the dubious and often equivocal relation between the drama as a literary product and the drama as a stage play tends to obscure the one significant fact: that the actor himself is truly creative. The identity between a literary figure and its histrionic counterpart cannot be preconceived, but has to be created in each individual instance. The actor does precisely this. Realizing the perennial human desire for transformation he creates an original personification which never existed before and admits of no duplication or imitation—not even by himself. This also accounts for an infinite variety of equally significant and convincing renditions of one and the same dramatis persona.

Primarily it is not so much important that a dramatic message be worth while to be communicated than that it be communicable at all. But it is also obvious that subject matter and form determine the interpretation to a very large extent. Involved scenic situations and complicated characters require a specific expressive technique in order to adequately cope with the increasing complexity of the task. In the early stages of theatre history there is no conflict as yet between spiritual, emotional or factual contents and their histrionic expression, since only that is expressed which is actually experienced or only experienced that which can be adequately expressed. As long as the performance deals with subject matter indiscriminately known to the entire assistance, performers and spectators are either identical or interchangeable. But once the performance enters the sphere of individual imagination and personal interpretation invisible barriers first, tangible ones later, separate the now essentially creative actor from an essentially receptive audience. At some psychologically significant moment in this evolution the medicine man or priest, on the strength of legitimate authority, seizes the prerogative of playing, leading or directing an activity, the potentialities of which serve his spiritual purposes, and not rarely his practical ones as well. Yet outside the realm of sacred ceremonial arises irresistably again the elementary urge to play and act, directly originating from or successfully appealing to the primitive instincts of the masses. And henceforth exists a perpetual, open rivalry between the representative drama of the church (in the broadest sense) and the popular theatre of the crowds. Naturally the popular forms of drama often degenerate into vulgarity and license, thus furnishing an ever valid motivation for the traditional anathema against mimes and comedians. It is certain, however, that as far as the European theatre is concerned but for this coarse mimetic activity there would hardly be any theatre at all between the disintegration of the Roman Empire and the revival of the ancient Greek and Roman theatre in the early Renaissance.

Fundamentally new, and still essentially valid problems enter the theatre with the naturalistic conception of the arts in general and of drama in particular. Here and now the actor is to interpret characters not within the open spaces of mimetic spontaneousness, nor within the wide horizons of poetic imagination, but expressly in the close perspective of physical and psychological veracity. While, on one side, he is thus lead to a confusing accumulation of artistically irrelevant, descriptive details, he acquires on the other a sensitiveness, nervous refinement and analytical

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

knowledge which benefits him with the microscopic technique of the film. Evidently this means a clear break with countless centuries of histrionic tradition, and the beginning of a problematic era. Problematic because the aesthetic (and indirectly the psychological) conflict resulting from this artistic attitude is unavoidable: any excess of realistic accuracy stresses the incompatibility between the almost-perfection of mere copy and the unrealistic quality of the scenic atmosphere. And the capacity of imitation is indeed the very reverse of the histrionic principle. For the principle of imitative characterization is the attempt at objectively creating reality; its ideal achievement is deception. The principle of histrionic characterization is an attempt at subjectively creating illusion; its ideal achievement is art.

In conclusion it may be said that any productive investigation of the theatre depends on the basic notion that theatrical reality, in whatever representation of dance, play and drama, is not conditioned upon its relation to objective, concrete appearance in space, nor on its measurable duration in time, but on the participants' spontaneous or deliberate acceptance of its specific validity. The typical conflicting views with regard to this condition are mainly due to the antagonistic directions of artistic endeavor: one tended toward unrealistic fantasy, the other directed toward naturalistic resemblance; each corresponding to either extreme of the performer's or spectator's motional or rational approach to scenic reality. However, if the scenic reality is to have artistic relevance, such relevance depends solely upon the degree of genuine theatric perfection, not on the exactitude, probability or truthfulness obtained in one direction, nor on the quantitative effort of imagination expended in the other.

A Study of Theatrical Art from The Beginning to the Present Day,* New York, 1927. —G.A.

**theatre art.** Art involved in theatre or dramatic activities, as setting the stage, providing lighting, and making costumes, properties, and scenery. Whitford and Winslow in *Dictionary of Education.*

**theatre dance.** A term used for a dance manner designed for the entertainment of the theatre audience. Because dance moves too swiftly for its meaning to be grasped by the average audience, it is essential that it be presented as directly and vividly as possible. To accomplish this dance calls to its aid costuming, helpful properties, music, and lighting as well as realistic and pantomimic movement. Although theatre dance, as it is known at the present writing, is not dance in its most highly developed abstract art form, nevertheless, it is a vehicle for great artistic treatment and it will continue to be an important agent in educating audiences in dance appreciation. (H'Doubler, M. N., *Dance, A Creative Art Experience,* F. S. Crofts & Co., 1940.)

**theatrical costume.** See COSTUME ART.

**thematic development.** *Mus.*. The varied repetition of a theme to bring out its inherent resources.

**theme** (Gr. *thema,* fr. *tithenai,* to set, place). (1) An image or set of images, details, qualities, ideas or appearances capable of being repeated, varied and contrasted with others. Such repetition, variation, and contrast are the basis of *thematic* development, *design,* and *decorative* composition (q.v.). The term is used most often in music, where it is applied to a short melody which constitutes the basis of variation and development. It is also applied to the visual arts and literature, where (for example) a certain color, pattern, or idea may be taken as a subject for repetition with modification. A *design* is an aesthetic form, or a factor in one, involving relatively complex and unified thematic development. —T.M.

(2) *Mus.* Musical idea; subject of a composition, susceptible of being treated in many various ways, the context of these treatments forming the *raison d'être* and the logical coherence of the composition. The theme may be identical with a motif (as it is the case with many fugue themes), or it may be a composite of several, even contrasting, elements (as it is the case with many sonata themes), provided these elements are welded together into one unit. —E.K.

(3) *Dance.* In its broadest meaning *theme* is a term used to denote subject matter or content of any nature, principal, or subsidiary. In its fullest significance, however, it applies

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to the main topic to be developed into a complete dance composition. The theme may originate in any activity, rhythmic scheme, feeling state, idea, literary concept, or a dramatic plot. —M.N. H'D.

**theorbo.** See MUSICAL INSTRUMENTS.

**theory of musical performance.** See MUSICAL PERFORMANCE, MAIN TRENDS IN

**Theremin.** See electrical instruments; MUSICAL INSTRUMENTS.

**thermionic valve.** See electrical instruments.

**thin ink landscape.** See CHINESE ARTS.

**thinner.** As the word is used in the paint trades, thinner can apply to either a solvent or a diluent of a painting medium. It may also be applied to a mixture of both and designates any fluid used to reduce a film material to a consistency suitable for application. Technically, a thinner is a diluent rather than a solvent. —G.L.S.

**thirty-three gods.** See INDIAN ART.

**Thoueris.** Ta-urt.

**thread mark.** Marks on the bottom of Japanese pottery caused by the use of a thread to separate the object from the potter's wheel.

**three-color ware.** Chinese pottery, the decoration of which is in red, blue and yellow colors.

**three-element tube.** See electrical instruments.

**three-point perspective.** See PERSPECTIVE.

**through.** See bond-stone.

**through stones.** In masonry: Stones which extend through the entire thickness of a wall to tie or bond it.

**throwing.** *Cer.* Process of forming ware by hand on potter's wheel. See CERAMICS I.

**Thule art.** See Eskimo art.

**Thuluth script.** See ISLAMIC ART.

**thumb-index.** *Book.* Half circles cut from the fore-edge for different sections of a book.

**thumb ring.** A large Chinese ring, generally made of jade, ivory or metal, worn on the thumb. See JEWELRY.

**thunderbolt.** See vajra (Skr.); ko (Jap.); dorje (Tib.); see SYMBOLISM IN FAR EASTERN ART.

**thyara.** See tiara, papal.

**thyrsus.** A staff surmounted by branches or a pine cone. Carried in Egypt, in Greek and Roman Bacchic rites, in May festivals in Europe. See FLOWER ARRANGEMENT.

**tiaoch'i** (Ch.). Carved lacquer ware.

**tiara, papal.** A head-dress of the Pope, used on occasions of high solemnity, but not during liturgical functions; at least from Innocent III (1198-1216) sometimes considered as symbol of the Pope's temporal power (cf. Migne, P. L. 217, 481 and 665). The shape was originally more or less conical, but since the 16th cent. the top is rounded and the sides almost straight. The tiara is surmounted by a little globe with the cross. In its present form it is adorned by three crown-like circlets, surrounding the body of the tiara at its base, middle and top. Originally, however, these crowns were lacking, although, from an early period, a diadem-like band, surrounded the base; the so-called *caudae* or *lemnisci* or *infulae,* bands hanging from the back or from the sides of the tiara, may have developed from the ends of the "diadem-band" just mentioned. The term *tiara* occurs in Herodotus and other Greek sources to designate a well-known Persian head-gear, esp. that of the king; some of the royal tiaras on Parthian coins are surprisingly similar to papal tiaras, not of the Middle Ages, but of the Renaissance, surely an accidental similarity. The name *tiara* is also used in the *Vulgata* for the head-dress of the Jewish High Priest (along with other expressions; see *Exodus* 28, 37; 29, 6; 39, 30; *Leviticus* 8, 9). Before the 16th cent., however, the usual names for what we call the papal tiara were ***camelaucum, phrygium, regnum, corona, diadema,*** and finally ***triregnum*** after the addition of the three crowns; the term ***thyara*** first occurs in the life of Pope Paschal II (1099-1118) in the *Liber Pontificalis,* but remains rare to the end of the Middle Ages. There is no direct evidence of the sources that would prove that the tiara of the Jewish high priest influenced the early development of the papal tiara. In literary sources the papal tiara first appears in the life of Pope Constantine (708-715) in the *Liber Pontificalis,* and there is called *camelaucum* which is still the name of a liturgical head-dress in the Greek rites. A little later,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in the forged "Donation of Constantine" the name of the papal tiara is *phrygium*. Both these names indicate origin from the east, and it is probable that hats or caps of conical shape, worn by Byzantine secular dignitaries, were used as models for the earliest papal tiara, which probably did not come into use before the wave of oriental influence swept over Rome in the 7th and early 8th cents. It is not impossible that the origin of the papal tiara had something to do with the beginnings of papal sovereignty in the nascent Papal States.

As to the first appearance of the crownless conical tiara of the Pope in surviving monuments, we have to refer to a coin of Sergius III (904-911). It is still rare in the 11th cent.; see e.g. the frescos in the lower church of *S. Clemente* in Rome. In this period the conical hat was also used by bishops outside Rome, to whom it usually had been conferred as a special honor by the pope; a clearer distinction between the tiara as a papal, non-liturgical and the mitre (q.v.) as a pontifical, liturgical head-dress took place soon afterwards; special forms of the mitre make their appearance in the monuments from around 1100 onward.

Benzo of Alba (*MG. SS.* 11, 672) says that in the coronation of Nicolas II (1059) Hildebrand caused a royal crown of two circles to be added to the tiara; perhaps he meant to say that this crown was no longer the diadem-like band, but that points or fleurons had been added like in the medieval royal crowns. Such a crown, at any rate, can be found on the base of the tiara in surviving monuments from the time of Innocent III (1198-1216). The older form with the simple band, however, still occurs in the monuments throughout the 13th century, and even longer.

A new and decisive change in the papal tiara occurred under Boniface VIII (1294-1303), as can still be seen in the extant effigies of this Pope; the change was probably made in the first Holy Year, in 1300. The height of the tiara was much increased so that it reached the extent of a cubit, which was the mystical measure used in the building of Noah's Ark, that ancient symbol of Church unity; thus the tiara's height of a cubit could serve as a symbolic indication of the Pope's leadership of the one and universal Church (see Bull *Unam Sanctam;* cf. Ladner and Schramm). Furthermore, in the tiara of Boniface, the ancient diadem-like band on the base was now combined with two crowns; one of them found its place immediately above the diadem, the other higher up. The recumbent Sepulchral statue of Boniface VIII in the *Grotte Vaticane,* it is true, does not clearly show the three circlets, but they can be seen in the statue in the *Museo Petriano* in Rome, which was likewise part of the sepulchre, and in that of S. Giovanni in Laterano; it is therefore, misleading to call the tiara of Boniface VIII a two-crown tiara, as is usually done. Boniface VIII tiara is actually enriched by three symbols of rulership, one diadem and two crowns, a fact which is borne out by papal inventories of the early 14th cent. which speak of the tiara of this Pope as adorned with three golden circles (see F. Ehrle, in: *Archiv für Literatur und Kirchengeschichte* 4 [1888] 191 ff.). It is probable that in conformity with Boniface VIII far-reaching formulations of the papal *plenitudo potestatis,* the three circles of his tiara symbolized the highest priesthood and the imperial and royal dignities. Perhaps, at this time, the tiara of the Jewish high priest also exerted some influence upon the development of the papal one, seeing that Josephus in his *Antiquitates* (3, 7, 6), which had long been part of Christian literary tradition, had said that the Jewish tiara was adorned with three crowns; still it must be said that there is no reference to the Jewish tiara in the sources dealing with that of Boniface VIII.

It was during the pontificate of one of the Avignonese Popes, probably Benedict XII (1334-42) or Clement VI (1342-52), that the diadem on the base of the tiara was replaced by a crown, so that three real crowns were placed one above the other at equal intervals. Since then there was no further essential change in the form of the papal tiara, except that it gradually lost its sharply conical form. See M. A. Mazzaroni, *De tribus coronis Pontifici Maximi,* 1587; G. Garampi, *Illustrazione di un antico sigillo della Garfagnana,* 1759; E. Wüscher-Becchi, Ursprung der päpstlichen Tiara (regnum) und der bischöflichen Mitra, *Römische Quartalschrift,* 13, 1889, 77 ff.; E. Müntz, La tiare pontificale du 8e au 16e siècle, *Mémoires de l'Académie des Inscriptions et Belles-Lettres,* 36, 1, 1897, 235 ff.; J. Braun, *Die liturgische Gewandung im Occident und Orient,* 1907, 489 ff.; K. Burdach, *Vom Mittelalter zur Reformation,* 2, 1, 1913-28; G. B. Tiara, *Historische Zeitschrift*, 152, 1935, 307 ff. —G.B.L.

**tie.** In construction: A structural member, as a timber, rod, etc., binding two bodies together, which have a tendency to separate or diverge from each other. —J.M.M.

**tie-dyeing.** A textile technique whereby the stuff is gathered up in small areas and wound with a dye-resisting thread, then dipped in the dye. When dry, the thread is removed thus producing a spotted patterned fabric. —J.A.M.

**t'ieh.** See SYMBOLISM IN FAR EASTERN ART.

**t'ien huang.** (Ch.). Seal.

**tier.** (1) To pile up in successive layers or ranges. (2) A rank or row in a series of things placed one above another.

**tierce de picardie.** See scales and modes.

**tiger.** See SYMBOLISM IN FAR EASTERN ART.

**tight back.** *Book.* When the back of the cover is attached to the back of the paper and bends with the book when it is opened.

**timbre.** That characteristic of tone which depends upon its harmonic structure, pitch level, and total intensity. The *harmonic structure* is expressed in terms of the number, the distribution, the relative intensity, and the phase relations of the partials in the tone. In a given tone this harmonic structure usually varies with the *pitch* of the fundamental and the total *intensity* of the tone. The word timbre, like the word pitch, is a psychological term referring to the mental aspect in hearing. But like pitch, it is often correctly used with reference to the physical aspect or in situations referring to both the physical and the mental. As we define pitch in terms of *frequency* of sound waves so we define timbre or, overtone structure, with reference to the *form* of the sound wave as expressed in terms of *harmonic structure* (q.v.). For certain purposes, timbre may, however, be defined in purely psychological terms giving recognition to the mental, musical, and auditory points of view.

Physically, the timbre of a tone is a cross section of tone quality for the moment represented by the duration of one vibration in the sound. It is mainly in terms of timbre that we differentiate the tonal character of musical instruments, of voice, of vowels, and all other sounds in art and nature.

The word *timbre* is a French word meaning stamp or character. The French pronunciation seems to add mystery to the connotation. I propose, therefore, that we pronounce the word in English as approved by Webster and use it as frequently and naturally as we use the word *pitch* or *time* and with the same degree of clarity.

Aside from the names for vowels, we have no satisfactory names for the vast variety of timbres possible. But progress in modern acoustics gives promise of a progressive building of terminology for timbre in terms of characteristics of the spectrum. It is quite within bounds of possibility to define and popularize a dozen or twenty names for the timbre of musical tones in terms of the position and relative dominance of its formant or resonance-regions. For example, one beautiful voice has a dominant region composed of the lower partials. Another, a next higher group, and so forth. Each formant region may be characterized by a wide or narrow band of partials. Another tone may be characterized by the presence of three or four namable formant regions. In other words, we have the material and the exact definition of the terms which can define any musical tone and the immediate problem is to familiarize ourselves with a working number of such classes. See phonophotography; sound wave; wave form; oscillogram; tone spectrum; tone gneerator; training in musical skills; timbre, sense of. —C.E.S.

**timbre, sense of.** A measure of talent or capacity for the hearing of the timbre (q.v.) of musical tones. Individuals may differ in capacity for hearing of timbre just as they differ in capacity for hearing pitch or rhythm. One individual may be 100 times as sensitive to timbre or tone quality as another individual of equal intelligence and training. The measurement may be made with a tone generator (q.v.) or with phonograph records as in one of Seashore's *Measures of Musical Talent* of which the following is a description.

For the purpose of building a measure of the sense of timbre we took a tone with the fundamental pitch of F sharp composed of six adjacent partials of known energy which made a rich and pleasing tone. To vary the steps of difficulty in this tone certain amounts of energy were taken from the third partial and added to the fourth with the total intensity of the tone kept constant. The prob-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

lem was to measure the least perceptible change in timbre caused by such shift. Ordinarily such measurements are made by the use of actual musical instruments but here the measurement is reduced to exact laboratory procedure whether it is made directly from the tone generator or from an adequate phonograph record from it.

For music and speech, this measure furnishes an index to the natural ability that a person tested has for hearing differences in "kind of tone" such as differences between instruments, differences in the playing of a given instrument, or in voices. A full account of this measure is contained in the reference here given: Saetveit, Joseph G., Lewis, Don, and Seashore, Carl E.: The Revision of the Seashore Measures of Musical Talents, *University of Iowa Studies,* 1940.

—C.E.S.

**timbre vibrato.** See vibrato.

**time imperfect** (tempus imperfectum). See MEDIEVAL MUSIC.

**time perfect** (tempus perfectum). See MEDIEVAL MUSIC.

**Timurid art.** See ISLAMIC ART.

**tinctures.** See HERALDRY.

**ting** (Ch.). Sacrificial bronze vessel; three-legged, with two upright vertical handles and sometimes a cover. Occasionally a square form. Used to hold sacrificial food.

—J.A.M.

**t'ing.** See CHINESE ARTS.

**ting yao** (Ch.). *Ting* pottery or *ting* ware. A thin, white porcellaneous pottery, semi-translucent and sonorous.

**tint.** Any color tone which has more or less brilliance than it would have in its spectral hue.

**tip.** This is a tool used by gilders and is a very thin, flat, square brush made of long hair. The hair is mounted in a light handle, usually of cardboard. The tip is used for picking up gold leaf from the gilder's cushion and laying it on the area where it is to stay.

—G.L.S.

**t'i pa** (Ch.). A general annotation written on painting or on the mounting of a painting.

**tipi** (Dakota, dwelling). The tipi, the conical house of the Plains Indians, was well adapted to their nomad life because it is portable and easily erected. It is made of three or four poles set up like a tripod and covered, originally, with buffalo hide strongly staked down, but now with canvas. At the smoke hole left at the apex are two projections or ears held by poles, which control the draft and cover the opening in bad weather. The exterior is often decorated with geometric or representational paintings. An average tipi is 15 ft. in diameter and 15 or more ft. in height.

—H.G.

**tipped-in.** *Book.* When a leaf, illustration, map, etc., is pasted in without guarding it is said to be tipped in.

**t'i shih** (Ch.). A poem inscribed on a painting.

**titanium white.** The white dioxide of the metal, titanium, has been found to have good qualities as a painter's pigment. It is distinguished by its hiding power in which it is stronger than white lead and far stronger than zinc white. Although it can be used pure, titanium pigment usually contains some amount of other white, the most common being barium sulphate in the amount of about 75 per cent. This is a modern pigment. The ore has been known since the latter part of the 18th cent. but only in 1916 to 1919 was the commercial production of the white undertaken.

—G.L.S.

**title-poem** (Fr. *titre poème*). See collage.

**Tjurunga.** See AUSTRALIAN ABORIGINAL ART.

**Tlingit art.** See Northwest Coast Indian art.

**T-motif.** An art motive often seen in Oriental art resembling the capital letter T.

**to** (Ch.). Bell form with clapper and handle.

**toad.** See SYMBOLISM IN FAR EASTERN ART.

**toccata.** See overture.

**togidashi** (Jap.). A term applied to lacquerware when gold, or silver, leaf is laid on and polished flush with the surface.

**togidashi-makie** (Jap.). A lacquer technique whereby the raised pattern is produced by successive layers of pure lacquer, polished.

**tohunga** (Maori). A leader skilled in the crafts or possessing traditional lore. See Maori carving.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**toiles-de-jouy.** Printed curtains, popular during the time of Louis XV. See INTERIOR ARCHITECTURE AND DECORATION; POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U. S. A.

**toki** (Jap.). Glazed earthenware.

**Tokoname yaki** (Jap.). Pottery made in Owari province.

**tokonoma** (Jap.). A recessed place of honor in a Japanese house in which *objets d'art* are shown. See JAPANESE ART.

**Tokugawa art.** See JAPANESE ART.

**tolerance.** *Mus.* The limit beyond which attempted artistic deviation or erratic deviation from the exact score or other supposed indications of fidelity and regularity in pitch, intensity, time, or timbre ceases to be acceptable. —C.E.S.

**Toltec.** Master builders; the generic name given to the makers of the high cultures in central Mexico. The term is applied in two ways: one, to dynastic groups who probably introduced and spread the Mixteca-Puebla cuture; second and more vaguely, to the makers of the Teotihuacan culture in central Mexico. —G.C.V.

**tomb figures.** See CHINESE ARTS.

**tomoe** (Jap.). A comma form. Two (or three) are often arranged to form a circular area. Used as a *mon* (q.v.) or as a decorative design. Its exact origin is unknown. —J.A.M.

**tonalism.** See POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U. S. A.

**tonality.** See idiom B.

**tone.** The designation of any color considered with respect to its attributes but indefinite as to the characterization of its attributes.

**tone color.** The *timbre* of a tone when the reference is to the tone spectrum and *tone quality,* when the reference is to the tone or selection as whole, including both timbre and sonance. It is proposed to scrap the ill-defined musical term color and adopt in the arts of music and speech the terms *quality* and *timbre,* meaning kind of tone as now defined in psychology and the physicial sciences. See tone quality. —C.E.S.

**tone generator.** An instrument for the generating of sounds in terms of blueprints or specifications for tonal timbre. There are now many forms of tone generators in use. For the purpose of description of the principles involved, the Iowa tone generator may serve as an example.

"This tone generator is built on the electrostatic principle and is capable of generating 16 pure tones standing in a harmonic series, thus representing 16 partials, or in music terminology, the fundamental and the first 15 overtones, if sounded together. Each of these partials can be varied in intensity. The wave phase can be kept constant. The instrument is therefore capable of producing any desired timbre of tone, generally spoken of as tone quality or color, that can be obtained from the permutations of 16 variables, which is more than a million. It therefore makes it possible for us to set up any kind (timbre) of a tone that may be desired and for each one of this enormous number of possibilities, to state exactly what the harmonic structure of the tone is in terms of the number of partials present, the amount of energy in each one, and the distribution of regions of energy. For example, the harmonic structure of any instrument, voice, or vowel within this range can be produced and reported with precision. Frankly, the performance of the instrument seems almost magical. This feeling is intensified when we submit the resulting complex tone to harmonic analysis (q.v.) and find that the tone spectrum built on the harmonic analysis corresponds exactly to the registration of the structure as set up on the tone generator.

"To put these technical statements into simpler language: here is an instrument with which we can produce any complex tone of harmonic structure that can be built from a fundamental with as many as 15 overtones varying in prominence; we know exactly what the structure of the tone is to be in scientific terms; and we can verify the accuracy of the production by comparing the harmonic analysis of it with the prediction. For example, if we have the tone spectrum for a given section of the note played by a great violinist, we can set up that tone on the generator, hear it sounded, and analyze it to see just to what extent the imitation corresponds to the original." C. E. Seashore, *Musical Educators Journal,* October, 1939. See E. B. Kurtz and M. J. Larsen, An Electrostatic Audiogenerator, *Electrical Engineer,* September, 1935. —C.E.S.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**tone quality.** That aspect of a tone which differentiates it from other tones in terms of timbre (q.v.) and sonance (q.v.). The most important basic attribute of all music is tone quality, meaning kind of tone. Tone quality, like harmony, volume and rhythm, is a complex in which the four elemental attributes of tone—pitch, loudness, time and timbre—function. In terms of these we can measure and describe all kinds of tone.

A musical tone has several distinct lives. It exists in the mind of the composer as image and idea; a great composer not only images the tonal structure which he is to employ, but hears out his composition realistically without recourse to any instrument. It exists in the mind of the performer, again as image and idea accompanied by musical feeling; the musical score is merely a cue which gives a basic suggestion for the artist to interpret. It exists as a physical tone consisting of sound waves. It exists in the mind of the listener, who experiences the tonal message in accordance with his capacities, musical background, and personality.

At each and all of these stages, we must consider the structure or quality; i.e., kind of tone. At the physical stage, the sound camera can intercept the tone and furnish a complete quantitative description of it in terms of sound waves. Therefore, both science and the art of music begin at this stage and work backward and forward towards the physiological, the psychological, and the musical interpretations.

It is entirely legitimate for a musician to describe his tone primarily in exact physical terms—indeed it should be demanded of him—even though he may be fully cognizant of the fact that the physical tone does not exactly correspond with what the artist intended or what the listener is to hear. Endless confusion comes into musical accounts of tones by a careless flirting between the physical and the mental facts.

Everything that is conveyed from the performer to the listener through hearing, is conveyed on the sound wave. The sound wave has four variables: frequency, which gives us pitch; amplitude, which gives us loudness; duration, which gives us time; and wave form, which gives us *timbre,* the crowning jewel of richness and beauty in sound structure.

Every sound wave has form. Form is absolutely as basic as frequency, intensity, and duration. This form is determined by the number, distribution, relative intensities, and phase relationships, of the partials.

In terms of the form of the wave, *harmonic analysis* (q.v.) enables us to describe completely the structure of a tone for that brief instant in which the single wave operates. This gives us a cross-section of the tone, revealing its basic structure. A diagram of this is called a tone spectrum (q.v.). In physics, the fundamental and its overtones are called partials, each treated as a single pure tone in the complex harmonic structure which the ear tends to integrate into a unitary tone or clang. We speak of this integration of the partials in a single complex wave as *simultaneous fusion.* In music this represents *timbre,* so far as we can symbolize the mental object by the physical object, and the tone spectrum, therefore, becomes a *timbre pattern.*

Exact measurements show that, almost without exception, the form of the sound wave changes from wave to wave; i.e., there is an internal flux among the partials that changes the tone from moment to moment, from wave to wave, throughout the duration of the tone. This stage, which contributes towards the quality of the tone, we call *successive fusion.* We have coined the term *sonance* (q.v.) to represent this progressive change in a tone.

The situation is analogous to that of the moving-picture film. The first frame of a series depicting, e.g., the progress of a smile, is a complete picture in itself; but each successive frame is slightly different, and the frames occur with such frequency that the pictures fuse in the eye. The successive fusion is the physical basis for our actually seeing the course of the smile. The simultaneous fusion of partials gives us a still picture; the successive fusion gives us a moving picture.

The simultaneous fusion, as in the rich tone of a violin, corresponding to the still picture, gives us the basic structure. In terms of the tone spectrum represented by a single wave, we can describe the basic tonal structure, the difference between one instrument and another, between one voice and another, and between one vowel and another. But to describe the full quality of a musical tone, we must add the progressive change which we call successive fusion or sonance. To parallel the term *timbre pattern,* I venture to coin the term *sonance pattern* to describe the progressive picture of the quality of a tone. As we do not see the individual image of a single frame in the moving-picture film, we do not hear the tone of a single vibration. However, physically both are basic structures.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

We speak of the physical tone, as well as of the psychological tone, as having quality, and here is the main point of my message: Quality in a harmonic musical tone consists of two phases—*timbre and sonance.* The timbre represents a cross-section of the tone; sonance represents progressive change. But there will be distortions in the harmonic structure, and to it there may be added inharmonic partials and noises. Each of these is determinable and measurable on the principle herein set forth.

But how will knowledge of harmonic structure help the musician in dealing with tone quality? Here we strike a most serious snag. We may secure, see, and describe perfect sonance patterns for thousands of tones in nature and art; but we have no exact names for any of them except one, the pure tone. The best we can do is to point to the picture, but that is not very practical. Will future acoustics give us such names? Yes, it will give us some fairly definable concepts with names. In the first place, it enables any musician who has a clear concept of any of the conventional names for tone quality, such as light or dark, to find out and state exactly what he means by this term. Such efforts will immediately lead to house-cleaning and rejection of terms on which musicians do not agree. We have a few terms on which there is fair agreement; as when we speak, in connection with vowels, of the *ah* quality, the *ee* quality, or the *oo* quality. Twenty or more such vowel qualities are fairly distinguishable and can be defined on the same principle. Thus, when we know that "vowel" means "quality", we have fairly acceptable names for a number of qualities. Acoustics will gradually build up other names; e.g., on the basis of the number of partials present, the form and regularity of their distribution. Progress in this direction will tend to clarify our musical terminology.

But current contributions to acoustics may be of considerable immediate advantage to the musician in that they may facilitate his understanding of the exact structure of his tone, his precision in musical terminology, his ability to hear and criticize tone quality with technical discrimination, and his ability to interpret his thoughts and feelings about musical quality in terms of tonal structure. See vols. I and IV in the *University of Iowa Studies in the Psychology of Music*; C. E. Seashore, *The Psychology of Music,* ch. 6; C. E. Seashore, The Harmonic Structure of a Musical Tone, *The Musical Quarterly,* Jan., 1939. —C.E.S.

**tone row.** See twelve-tone technique.

**tone spectrum.** A qualitative and quantitative graphic representation of the structure of a tone in cross section for the duration of one sound wave revealing the structure of the tone in terms of the number of partials present, their distribution within the tonal register, and the percentage of energy of the tone as a whole contributed by each partial. The spectrum also indicates the fundamental pitch and the total intensity of the tone as a whole. It reveals the grouping of dominant regions of the partials known as formants, if present. This is a definition of the physical spectrum. Various forms of corresponding psychological spectra are so constructed as to indicate how the physical tone is perceived. —C.E.S.

**tongue pattern.** In classical art, especially in Greek architecture and pottery, a decorative pattern consisting of a row of contiguous units of long narrow shape with bottom corners rounded, each with a border around the sides and bottom. —L.T.S.

**tongue rug.** Usually doormat size made of pieces of cloth about three inches wide by about five inches long, rounded at one end. Pieces were blanket stitched with woolen yarn around three edges to keep them from ravelling and sewn at their narrow straight end, to a foundation of burlap. —B.E.J.

**tonic.** *Mus.* The key note of a scale, the tone on which a scale is built up and from which it takes its name. See idiom B (1); scales and modes.

**tonic sol-fa.** See movable do.

**tonoscope.** An instrument which converts sound waves into moving picture patterns on the principle of stroboscopic vision. It is designed to measure vocal and instrumental pitch performance in remedial and general training in the mastery of a musical skill and to tune standardize and measure the response of musical instruments.

"One of the first demands in our equipment for the psychology of music was for an instrument which would enable us to see ourselves sing or play in terms of all aspects of pitch; such as attack, release, and the sustaining of a tone, regarding conformity to true pitch and the possibility of artistic deviations from true pitch, each essential to the art of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

music. The original instrument for this purpose was the tonoscope which converted the vibrations of sound into visual pictures so that the moment you sang or played a tone you could see instantly the degree of success or failure.

"In 1893 Scripture conceived the idea of building a tonoscope on the principle of stroboscopic vision and I collaborated with him. In Iowa this conception went through a series of stages and we built one model after another; first, in the direction of making it adequate however costly, and then in the direction of simplifying models, taking advantage of new resources coming in from time to time. The idea was that when playing or singing a tone, the exact pitch intonation should be exhibited visually for the duration of the tone within accuracies of from .10 to .01 of a whole tone step, the degree of precision depending upon the steadiness of the registering tone.

"Music teachers generally today are in a position analogous to that of the otologist a generation or two ago who had but few and insignificant instruments for exact and convenient measurement of the character and loss of hearing, function of the vocal cords, and location of lesions. Today the up-to-date otologist's office is equipped with audiometers, oral cameras, X-ray cameras, and fluoroscopes. So the progressive music teacher of the near future will be equipped with up-to-date instruments for quick and accurate measurement of the four elements of tone, of which the measurement of pitch is the first to attract attention. Thus we paved the way for the development of a new feature in teacher-training institutions; namely, the use of instruments in the development of musical skills, and our original goal has been reached. There are now on the market a variety of tonoscopes built on the most recently developed electrical principles of stroboscopic control of which the Conn Chromatic Stroboscope is perhaps the best at present. My *Measurement of Pitch Intonation with the Tonoscope in Singing Playing* gives a general account of principles involved and serves as a manual for remedial and general training in pitch as a musical skill." C. E. Seashore, *Pioneering in Psychology: University of Iowa Press, 1942.*

**tonus peregrinum.** See psalm tones.

**tooth ornament, dog tooth.** Tooth ornament such as used in the Romanesque and early Pointed styles consisted of a series of pointed toothlike forms. Also see dogtooth.

**tope** (Hind.). See stupa.

**topia** (L.). Landscape mural decoration depicting diverse and fanciful scenes.

**Topographers, The.** See CANADA, ART OF.

**torana** (Skr.). A gateway of upright pillars with two or more transverse members, usually a part of the perambulatory surrounding a stupa (q.v.). See INDIAN ART.

**torculus.** See neumes.

**toreutics.** Sculpturing by embossing, chasing, etc., esp. in metal.

**torii** (Jap.). A gateway of two pillars and generally two transverse members, seen before, and erected over, the pathway to a temple.

**torse.** See HERALDRY.

**tortillon.** This is really a small stump, a spreading or smoothing tool used by draftsmen with charcoal and crayon. It is made of soft paper rolled in such a way as to give a conical point at one end. —G.L.S.

**tortoise.** See SYMBOLISM IN FAR EASTERN ART.

**torus.** A large moulding of single convex curve in the form of a half circle; used especially for bases.

**Tosa school** (Jap.). A school of painting depicting historic episodes after the *Yamato-e* style (q.v.), reaching its peak about the 15th cent. See JAPANESE ART.

**totara** (Maori). A tree, closely related to the yew. See Maori carving.

**totem pole.** A pole carved and painted by the Northwest Coast Indians (q.v.) to display the heraldic devices and social rank of the family, to illustrate a legend, or to honor the dead. It was set up in front of or against the house, or served as a support to the beams. Carved from red cedar, abundant and gigantic in the region, the poles vary in height from 3 to 70 ft. The carvings represent animal, bird, or mythical guardian spirits with which the family is identified and from which it draws qualities peculiar to the being. See PRIMITIVE ART; CANADA, ART OF; also Frederic H. Douglas, *Totem Poles,* Denver Art Museum Leaflet No. 79-80 (1936). —H.G.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**Totonac.** The name given to the linguistic group living in the present state of Vera Cruz in Mexico. This name is also given to archaeological objects found in that area. There is, however, too much stylistic variation in terms of time and space to warrant the belief that these very fine arts were all the work of the same people. —G.C.V.

**tou** (Ch.). Sacrificial bronze vessel. Globular form, with cover, on a stem standard with flaring base. Supposed to hold votive meat.

**tou fang** (Ch.). A small album-picture, usually square.

**Touraine, school of.** See FRENCH ART.

**tourdion, tordion.** See galliard.

**Tournai school.** A popular school of art that developed in 15th cent. Tournai that was conventionally religious. It influenced the schools of Ghent, Haarlem and Louvain. The leaders of the school at Tournai were Robert Campin and Roger Van der Weyden. —R.L.W.

**Tours, school of.** See Carolingian art.

**tower.** A structure, usually very tall in proportion to its depth and width, frequently forming a part of, and generally rising above, a larger structure or building. —J.M.M.

**townless highway.** See CIVIC PLANNING.

**town planning.** See CIVIC PLANNING.

**trabeated portico.** See portico.

**tracery.** Ornamental work with ramified lines, as in the head of a Gothic window or in some styles of vaulting.

**tract.** See psalmody; Mass; MEDIEVAL MUSIC.

**trade binding.** See edition binding; EARLY BOOKBINDING AND FINE BINDING.

**traffic, aesthetics of.** Means of traffic and transportation are more modified in their appearance by modern design than any other elements and utensils of daily routine. It is highly characteristic that the most technical objects of our time follow in this way most closely the trend of modern art and are influencing vice versa the visual apperception of the two last generations.

Quickly moving machines, the locomotive, the car, and the airplane, calculated and shaped by engineers, showed first no functional design at all. The first locomotive looked like a richly ornamented piece of furniture, the first car like a horse-drawn coach without horses, the first airplane resembled a gigantic children's kite. Gradually technique and functional necessities, among them the need for housing the increasing driving power, for overcoming the resistance of air, the simplification of power transmission, etc., changed their forms. However, it was not before the beginning of the 20th cent. that the specific beauty of technical perfection was achieved and more generally appreciated.

During the last three decades conscious consideration of this typical technical beauty began to influence the forms of locomotive, car, and airplane. Sometimes the engineer even called voluntarily for the co-operation of an architect, or an industrial designer in launching a new model. Modern industrial design got the greater stimulus from these demands.

In the realm of architecture proper, railway stations, gas stations, garages, airplane hangars, complicated highway turnpikes, became legitimate tasks for artistic moulding, based, of course, upon functional fulfillment of the engineering needs. It is impossible to overestimate the influence of the thus created forms upon other problems of modern architecture.

Finally, modern traffic influences also generally the aesthetic conception of our time. The visual apperception of the last generation has entirely changed through the adjustment to the speed of modern traffic and the experience of large covered distances. Birds-eye view from the flying airplane, spread through the movies, became an ordinary experience. The consequences of these various influences are mirrored in architectural forms as well as in modern painting and, of course, in industrial design. The experience of speed does not allow the enjoyment of complicated ornamentation, and modern trends in painting beginning with Futurism tried to freeze the sensation of the daily experienced speed by simultaneous representation of moving objects. Post-Futuristic painting sublimized this tendency. See engineering, aesthetics of; streamlined; functional architecture; CIVIC PLANNING; also George R. Chatburn, *Highways and Highway Transportation,* 1923; Le Corbusier, *La Ville Radieuse,* 1934; N. Pevsner, *The Pioneers of the Modern Movement, from William Morris to Walter Gropius,* 1936; Lewis Mumford, *Technics and Civilization,* 1934; Cyril Bruyn Andrews,

**traffic circle, lane.** See CIVIC PLANNING.

**training** (in basic musical skills). The basic musical skills are the control of pitch, intensity, time, and timbre. In various combinations, these appear in complex forms as in harmony, melody, rhythm, volume, and tone quality. Training in these should be the ABC of musical education and by the use of instrumental aids, this training can be vastly shortened and sharpened beyond the degree obtainable without the use of instruments. The fundamental principle involved is that the ear is trained by aid of the eye. The singer or player can *see* the tonal, the dynamic, the temporal, and the qualitative aspects in turn as he plays or sings. The visual pictures offer a measuring scale which reveals details finer than the ear can hear.

"One of the goals of the psychology of music is to apply scientific principles to methods of training which shall guarantee insight into the nature of the learning process, a shortening of the time of training, and attainment of higher precision and mastery than is ordinarily obtained. In this, it follows the universal requirement of the scientific procedure of dealing with one specific factor at a time, employing objective standards and measurements of performance.

"Training begins with the most elementary steps by setting up efficient habits which become thoroughly fixed so that they function automatically in the actual musical situation. A fundamental requirement is that the pupil shall know exactly what element in the music he is trying to master in a given assignment, shall have an objective check on his achievement in this for every trial, and shall practice until this particular control of tone is completely established as a habit.

"Instruments for such a purpose are fast coming upon the market and are reasonably priced so that, for the price of a good piano, one can equip a studio adequately. A single equipment of this kind can serve an entire large school; the cost is not prohibitive for a music school or a department of music in a public school.

"At present, the problem is to convince music teachers of the possibilities and significance of this scientific approach to musical training. The instruments are here and more are coming. The first essential is knowledge of the fundamental techniques in the psychology of music. Courses in that subject are fast developing in progressive teacher-training institutions. The range of possibilities is unlimited when we once establish confidence in the idea that it can be done.

"One of the most valuable principles involved in most of these instruments is that the sound wave is converted into a visual picture so that the moment one sings or plays a given note, he will see on a dial or some other dictator, the exact performance of the element under consideration. These visual pictures of sound waves are to the student of music what the microscope is to the student of microörganisms: every element in the tone produced is enlarged; even factors not recognized by the unaided ear become clear and conspicuous.

"A laboratory studio of this kind assumes three aspects: first, the measurement of natural talent at the beginning of practice; second, training in the acquisition and refinement of specific skills in musical performance; and third, measurement of achievement. The talent testing should include on the one hand measures of musical hearing and, on the other, measures of natural talent for motor skills." C. E. Seashore, *Pioneering in Psychology*: University of Iowa Press, 1942. See also, C. E. Seashore, *Psychology of Music,* 1938.

**tram** (original L. *trama* meant weft). A soft silk yarn.

**transept.** The part of a cruciform church which crosses at right angles to the greatest length and between the nave and apse or choir; loosely, one of the arms, or projecting ends, of a transept.

**transferring.** A process of printing from one surface to another. In lithography a crayon drawing is made on a specially prepared gesso paper, dampened and then printed on a stone. It is then processed and printed as a lithograph. Transfers are made by taking a print on gesso paper from one stone and printing it on another as in commercial lithography.

—R.L.W.

**transmissance.** See COLOR.

**transom.** A horizontal piece framed across an opening; hence, a window or opening above such a bar.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**transom-bar.** A horizontal construction dividing a window or opening into stages.

**transpose.** *Mus.* To change a composition from one key to another.

**transposition.** See twelve-tone technique.

**transverberation.** A mystic experience of Sta. Theresa: the piercing of her heart by an angel by means of a flaming arrow. Frequently represented in Baroque art, the most famous rendition being that by L. Bernini in the church of Sta. Maria della Vittoria, Rome. —R.B.

**transverse flute.** See MUSICAL INSTRUMENTS.

**tread.** The horizontal part of a step.

**treasure boat.** See SYMBOLISM IN FAR EASTERN ART.

**treatment.** See design.

**treble clef.** See clef.

**Trecento school.** See Florentine school.

**tree-fungus.** See SYMBOLISM IN FAR EASTERN ART.

**tree of life** (L. *arbor vitae,* tree of life). In classical art, a conventionalized ornament based on the arbor vitae tree, a tall narrow shape rounded at the bottom and coming to a point at the top. —L.T.S.

**tree ring dating.** See dendrochronology.

**tremolo** (in voice). A bad vibrato; a periodic pulsation or quivering in tone which does not contribute toward a pleasing flexibility, tenderness, or richness of tone. The terms vibrato and tremolo have been confused for the last 1700 years. Experimental analysis by phonophotography reveals that in the most generally accepted meanings the two terms refer to the same tonal eelments, namely, pitch, intensity, time, and timbre, singly or combined, and that they must be evaluated in relation to the same goals; namely, flexibility, tenderness, and richness of tone. The tremolo is, therefore, a vibrato and since in musical literature the tremolo is most generally regarded as undesirable, it is proposed on laboratory analysis to stabilize this terminology in vocal sonance (q.v.) by speaking of a good vibrato as a vibrato and a bad vibrato as a tremolo. For distinction between "good" and "bad" vibrato, see article on vibrato in which it is shown that the distinction is a relative one depending upon the listener's sense of vibrator (q.v.) and many othe psychological and physical factors. Hence what is the vibrato to one person may be a tremolo to another, usually a person with a fine musical ear. In general, a vocal tremolo is excessive or irregular vibrato. The same principle applies in general to musical instruments. But in the instrumental field there has been and are yet several other meanings to features which cannot be classified as vibrato. It would be well if these could be reviewed critically and given other names. These should include only cases, which may not be regarded as vibrato whether they be good or bad. See VIBRATO; also *Iowa Studies in Music,* vols. I, III, and IV. —C.E.S.

**trench.** A long narrow excavation in the ground or given level; a ditch.

**trepak.** The trepak constitute one of the four general types of Russian national dance. They are perhaps the most unrestrained, and have been called "Bacchanalian", in contrast to the romantic kamarienskaya, the dramatic kasatsk, and the ballad-dances of the chorovody. Unlimited freedom of movement, building to an almost frenzied figure of whirling and springing into the air, characterizes the trepak dances. —J.G.

**tressure.** See HERALDRY.

**trestle table.** See FURNITURE.

**triad.** *Mus.* A three-tone chord composed of a root, its third and fifth in ascending diatonic order.

**triadic color scheme.** See COLOR.

**trial proof.** *Etch.* An impression from a plate which is not completed. See PRINTS AND PRINT PROCESSES.

**triangle.** See MUSICAL INSTRUMENTS.

**tribunal.** See EARLY CHRISTIAN ARCHITECTURE.

**triclinium.** A couch reaching round three sides of a table for eating in a reclined position; a room having such a couch.

**triforium.** The gallery forming an upper story to the aisle of a church, often having three openings to each bay.

**triglyph** (Gr. *triglyphos* fr. *tri,* three + *glyphein,* to carve). In the Greek Doric

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

order, the vertical member of the frieze which alternates with the metope, a projecting block marked by two vertical grooves on the face and a half groove at each corner. —L.T.S.

**trill** (Ger. *Triller*; Fr. *trille*). Same as shake (q.v.). Phillip Emanuel Bach specifies four different types of trill; viz., the trill proper, the trill from below, the trill from above and the imperfect trill, half trill, transient trill or Pralltriller. —F.D.

**trio.** *Mus.* (1) A composition for three voices or instruments. (2) The middle part of a minuet or scherzo.

**trionfo.** See STAGESETTING.

**tripartite temple.** See MESOPOTAMIAN ART.

**triple fugue.** See fugue.

**triplet, triole, triolet.** Three equal notes which are to be performed in the time allotted to two of the same kind.

**trippant.** See HERALDRY.

**triptych.** (1) Three panels, generally designed as a single composition; commonly seen in Japanese wood-block prints. See also altarpiece. (2) *Book.* A tablet of three leaves hinged so that it can be folded to show a new "page".

**triquetra.** A triangular figure or ornament.

**triregnum.** See tiara, papal.

**tristimulus values.** See COLOR.

**Triton.** An ancient Greek sea demigod.

**tritone.** The interval from f to b, called by medieval musicians *diabolus in musica.* It was avoided in ancient liturgical melodies. Later medieval theorists asserted that the b flat was introduced in order to avoid the tritone. See musica ficta. —V.A.

**trivium.** See Quadrivium.

**trobar clus.** See MEDIEVAL MUSIC.

**trombetta.** See MUSICAL INSTRUMENTS.

**trombone.** See MUSICAL INSTRUMENTS.

**trope.** See MEDIEVAL MUSIC.

**troubadours, trouvères.** See MEDIEVAL MUSIC.

**trough.** A long or narrow open receptacle or channel, as for holding or conducting food or water.

**true blue.** See lapis lazuli.

**true porcelain.** See CERAMICS II.

**trumeau** (Fr.). In medieval architecture, a supporting column in the center of some large doorways.

**trumpet.** See MUSICAL INSTRUMENTS.

**trunk highway.** See CIVIC PLANNING.

**truss.** *Arch.* A bracket.

**truth.** This term is frequently used in literary criticism as synonymous with sincerity (q.v.), where it means that the work is a faithful account of the artist's feelings and sentiments, with no adjustment to what might be expected or desired by the public. It is also employed in a more special sense to indicate that the work is faithful to the external environment to which it refers. The predicate "true", as used in criticism and attached to art, does not carry the meaning of correctness or correspondence that is involved in philosophical and matter-of-fact conceptions of truth. Truth in the artistic context indicates that a work illuminates some aspect of its subject that is open to normal and healthy experience. Art is here held responsible to some "real" world, and is called true when it increases our awareness of this world. —I.J.

**ts'ao ch'ung** (Ch.). Grasses and insects; one of the stipulated subjects in a Chinese school of painting.

**tschin.** See RUSSIA, RELIGIOUS PAINTING IN.

**ts'ê yeh** (Ch.). An album (of paintings).

**T-shaped fibula.** See JEWELRY.

**Tsimshian art.** See Northwest Coast Indian art.

**tsuba** (Jap.). Sword-guard, located between the handle and the blade, to protect the hand.

**tsuikoku** (Jap.). Carved black lacquer.

**tsuishu** (Jap.). Carved red lacquer, whose color is due to the use of cinnabar. Often known as "cinnabar" lacquer.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**tsuitate.** (Jap). A solid, single-paneled screen with two low transverse feet, on the surface of which the artist paints pictures, generally of a decorative nature.

**tsuka** (Jap.). Handle or hilt of a sword.

**tsun** (Ch.). Sacrificial bronze vessel. Vase-like jar with flaring rim and a base.

**ts'ung** (Ch.). A jade form used in ritual, especially in burial, as the earth symbol. It combines an inner cylindrical form with an outer rectangle, the cylinder usually projecting at top and bottom. —J.A.M.

**tuba.** See MUSICAL INSTRUMENTS.

**tubecta.** See MUSICAL INSTRUMENTS.

**Tudor.** The Tudor period marked the belated emergence of England from the Middle Ages into the Renaissance. Her most striking response to the new enlightenment was. perhaps, political. Henry VIII (1504-47) broke with Rome, and Elizabeth (1558-1603) crippled the feudal lords, survived the Spanish Armada, laid the foundations of an empire, and brought to her land a prosperity and tranquillity unprecedented in its history. The artistic reflections of these changes are varied: Henry VIII commissioned Holbein to do some of the world's masterpieces of portraiture, but the string of Germans, Flemings, and Italians, like Torrigiano, who crossed the Channel were, for the most part, second-raters. This fact, the natural insularity of the English, and the conservatism which clung to the picturesque Gothic skyline, rendered the classical orders quite superficial, even, in the column-chimneys of Burghley House, somewhat ridiculous. But healthy influences were at work. The predominance of churches gave way to a predominance of domestic dwellings, some of England's greatest, like Hampton Court, Burghley House, Montacute House, and Wollaton. Owing to extended peace, these abandoned the formidable Medieval fortress character for great bay windows which overlooked fine gardens and parks. Plans became more open and symmetrical, sometimes employing, as a tribute to the monarchs, the H of Henry or the E of Elizabeth. If classical motifs were at best a picturesque veneer, the brick-and-stone work of the period is among the finest of mural treatments. In the field of literature, always England's most vital form of expression, Spencer, Raleigh, and Shakespeare bowed to no contemporary on the continent.

An interesting present day evidence of Tudor influence is to be found in the architecture of many American colleges and universities. Washington University, at St. Louis, Missouri, is a particularly fine and consistent example. See GT. BRITAIN, ARCHITECTURE OF, INTERIOR ARCHITECTURE AND DECORATION; FURNITURE. —P.C.B.

**tueh** (Ch.). Sacrificial bell form. Clapperless, with handle.

**tufted rug or carpet.** See pile.

**Tughra script.** See ISLAMIC ART.

**tui** (Ch.). Sacrificial bronze vessel. Sometimes three-legged, with two loop handles at the sides.

**tumulus.** An ancient grave mound.

**t'ung ching** (Ch.). Several hanging paintings that make up one large composition.

**tung oil.** Little used as a painter's medium, oil from the seeds of the *Aleurites cordata,* a tree growing principally in China and surrounding countries, has had an extensive use, particularly for surface varnish, in the heavy paint industry. It is also called Chinese wood oil. —G.L.S.

**tuotilo.** See MEDIEVAL MUSIC.

**turbat** (Ar.). A monumental tomb. See ISLAMIC ART.

**Turkestan, art of.** See CENTRAL ASIAN ART.

**Turkish knot.** See Ghiordes knot.

**Turkish rugs.** Includes all those rugs that are manufactured within Turkey. They are not so finely woven as Persian; they have a longer pile and looser texture. Each rug-weaving district of Turkey seems to have a distinct and individual class of rugs. See *Persian rugs* for references of classifications of Turkish rugs. —B.E.J.

**turn.** *Mus.* A grace note of extremely varied execution, defined by Philipp Emanuel Bach as a simple *manier* that makes a singing melody more pleasant and brilliant. —F.D.

**turpentine.** In the Western hemisphere this term is used to define what in Britain ordinarily goes by the term, spirits of turpentine, a distillate from balsam. The crude resinous exudate may come from any of a number of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pine trees, larch, and fir. Distilled turpentine is a volatile solvent for oil and for most varnishes. Although its general history reaches into the ancient world and although the distillate has been made since the 8th cent., it may not have been used in the art of painting before the Renaissance. Leonardo da Vinci speaks of it but does not specifically mention it as an oil solvent. —G.L.S.

**turret.** A small tower, usually rising above a larger structure.

**turtle.** See SYMBOLISM IN FAR EASTERN ART.

**Tuscan architecture.** See Romanesque architecture.

**Tuscan red.** See iron pigments.

**Tuscan school.** See Florentine school.

**tussy mussy.** A bunch of flowers put together to convey a message through the symbolism of the materials chosen. See FLOWER ARRANGEMENT.

**tutti.** *Mus.* All. Used especially in contrast to "solo".

**tutu** (Fr. [?] diminutive, derived from second person singular *tu*). The skirt worn by female dancers in classic ballets, usually of layers of tarletan. There are two traditional styles, the long, "romantic", bell-shaped skirt originating ca. 1832 with Taglioni, and the short, so-called "classic skirt" originating with the Italian Zucchi (1887), who clipped off the length of tarletan in the old style skirt to create a new. The term *tutu* of mysterious origin, perhaps close to *frou-frou,* etc., usually refers to the later style. —L.K.

**twelfth.** See ACOUSTICS.

**twelve-tone scale.** See scales and modes.

**twelve-tone system.** Current, but erroneous designation of the twelve-tone technique (q.v.).

**twelve-tone technique.** Technique of composition evolved by Arnold Schönberg within the idiom of atonality (see idiom, C). The basic principles of the twelve-tone technique are the following:

(1) Anyone of the 479,001,600 available different successions of twelve different tones can be made the "basic series", or "tone row", of a composition, or a comprehensive section thereof, or of a group of compositions.

(2) Within the musical area thus circumscribed, the basic series is used exclusively for the formation of all elements of the composition (melodies, chords, motifs, themes, etc.) in such a way that the area under consideration forms an unbroken chain of consecutive entrances of the basic series.

(3) Any number of tones of the series may appear simultaneously.

(4) Transposition of individual tones of the series to higher or lower octaves is admissible.

(5) The series may assume any rhythmic shape.

(6) The following derivative forms of the series are available: (a) **Inversion** (direction of the original interval progressions changed into its opposite; see inversion); (b) **Retrograde form** (original series running backward, from its last to its first tone); (c) **Retrograde inversion** (direction of the interval progressions of the retrograde form changed into its opposite); (d) The pitch level of the original series and of each of its derivative forms can be changed eleven times (**transposition**) so that each form may begin with any of the twelve tones.

(7) Any number of the 48 series forms thus obtained may be used simultaneously in the manner indicated under 2.

(8) Any series form may be divided among several voices, provided the resulting succession of tones on the whole is identical with that of the underlying series form.

(9) Repetition of tones, or of groups of tones, of the series is admissible conditionally.

The twelve-tone technique has grown out of the practice of composition in the **atonal idiom** and has shown its particular usefulness within that idiom. It is, however, not identical with, or a synonym of, atonality. **Atonal music** can be, and has been, written without the aid of the twelve-tone technique. On the other hand, selection of suitable basic series permits of composition in other idioms than the atonal by means of the twelve-tone technique. The principles outlined above, being subject to manifold modifications and further evolution in the practice of numerous contemporary composers, are of high pedagogical value as a method of counterpoint (q.v.) in making students of composition acquainted with the peculiarities of the atonal idiom. —E.K.

**twill.** A weave of fabric in which a series of regularly recurrent warp threads pass in echelon over and under the weft threads

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

two or more at a time is called a twill. Roughly, in appearance it produces an effect of diagonal ribs or of stepped patterns, depending on how the warp threads are carried. Twill was a favorite weave in painters' canvases from the 16th cent. on. It seemed to be much used by the English portrait painters of the 18th cent. and, although it has continued to the present, it is less a favorite now than formerly. See weaving. —G.L.S.

**twin fish.** See SYMBOLISM IN FAR EASTERN ART.

**two-point perspective.** See PERSPECTIVE.

**two-step.** A dance in 2/4 or 6/8 time with two accents to the bar.

**typographic.** See ex libris.

**Tyrian purple.** Among the few coloring materials particularly characteristic of ancient and medieval times is the so-called Tyrian purple, a rare organic dye prepared from several species of mollusk. Occasionally it has been called whelk red. Pliny said that the best quality of this dye was made at Tyre. It was the color used in togas of Roman emperors and is principally known in the arts as the purple dye used in coloring parchments. —G.L.S.

**Tyrolienne.** A Tirolese round dance in 3/4 time.

**Tz'u Chou yao** (Ch.). Chinese pottery of the *Sung dynasty*. The body is covered with a creamy white slip and decorated with impressionistic sketches.

**t'zu t'ai** (Ch.). *Chun-yao* (q.v.) with porcelain body.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

# U

**uchiwa** (Jap.). Round fans, the surfaces of which are often decorated by the best artists.

**uchiwa-e** (Jap.). Paintings for non-folding fans.

**ud.** See MUSICAL INSTRUMENTS.

**ugly.** The property ascribed to an object which disappoints painfully an aesthetic ideal.

**Ukiyo-e school** (Jap.). Literally, pictures of the every-day world. A school of genre painting at its peak in the 18th cent. See JAPANESE ART.

**ultra-baroque.** Inclusive name for several extravagant Mexican styles of the first three-quarters of the 18th cent.

**ultramarine blue.** Although a modern synthetic pigment goes by this name, the natural ultramarine made of powdered lapis lazuli is the one usually meant in the fine arts. When this stone began to be taken over as a pigment is not known. Apparently the ancient Egyptians did not use it. The principal source is in Afghanistan and it occurs in wall paintings of cave temples in that region as early as the 6th and 7th cents. Its presence has also been reported in Byzantine illuminated manuscripts of the 7th cent. and it continued in use in the painting of Europe until it was displaced to some extent by the blue crystalline pigment known as smalt and later by more intense artificial blues. These were much stronger in their tinting strength, easier to use particularly in oil, and far cheaper. —G.L.S.

**ultra-violet ray photograph.** One taken under the short wave lengths in the ultra-violet end of the spectrum. A quartz lamp and special filter produce the vibrations.

**Ulysses.** Odysseus.

**Umayyad art.** See ISLAMIC ART.

**umber.** A raw and burnt brown earth pigment is called umber. In color the raw material is dark and inclined to a neutral greenish brown. Burnt umber made by roasting the raw earth is redder and warmer in hue. The umbers are characterized chemically by the presence of manganese dioxide in addition to the iron oxides common to all the earth pigments. Although its name would indicate that it came from a region of Italy, it is widely distributed, and one of the best varieties known is Turkey umber, found on the island of Cypress. —G.L.S.

**Umbrian school.** See ITALIAN ART.

**Unakah.** See CERAMICS II.

**uncut.** *Book.* The margins uncut as issued in rebound books. Paper full size and not cut after binding in new books.

**uncut edges.** *Book.* Edges that have not been cut flush.

**underglaze painting.** Decoration applied directly with metallic oxides to the biscuit of porcelain, and covered with transparent glaze, is called underglaze painting.

**underground.** See CIVIC PLANNING.

**underpass.** See CIVIC PLANNING.

**unequal temperament.** See ACOUSTICS.

**ungen** (Jap.). See JAPANESE ART.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**unguentarium** (L.). Vessel used to hold unguents.

**union carpet.** See carpet structures.

**unison.** The sounding of the same tone by two or more voices or instruments.

**unity.** Means that all component parts of a work of art must be combined in such a way that the final result is a whole. But there is a distinction between formal and spiritual unity. Formal unity means about the same thing as balance (q.v.) which is achieved when all single parts are counterbalanced, as a common pole unifies all the forces. Spiritual unity means that all single spiritual parts of a work of art must converge toward one concentrating spiritual pole. The final goal of the spiritual factors of a work of art cannot be for instance both God and material or both idea and accident. In such a case the consequence can only be a confusion which causes dissatisfaction. The more formal and spiritual unity are bound together and the more logical the whole unity is, the more satisfactory is the effect and the greater the psychological solution. To accomplish this result the focal point must be unequivocal, and as far as possible it must be comprehensive, which implies it should have a universal value. The best work of art is created when a chance occurrence is related to a last unifying coherence in an unambiguous way. This unity results in the feeling of a complete satisfaction which means a materially useless one. For the human will is always striving to reduce all the variations of the universe to one immaterial least common denominator. See variety in unity. —A.J.S.

**universal artwork** (Ger. *Gesamtkunstwerk*). The notion (literally) that all the arts including painting, music, architecture, poetry, *et al.*, be combined into one unified art object. This conception was apparently suggested as early as Johann Mattheson, the 18th cent. composer and theorist, who saw in the opera theatre an academy of the fine arts wherein such a universal artwork could be produced. The idea of a *Gesamtkunstwerk* has been linked with 19th cent. romanticism and more particularly with Richard Wagner. With Wagner, the universal art work takes on a more specific meaning, viz., that of the tonal drama. He early conceived opera as evolving naturally from number opera to the music drama; i.e., from opera consisting of a series of occasions for singers to display their individual excellence to a drama in which symphonic music is utilized to portray subtle and deep emotions incommunicable by words and dramatic action. (It is this theory of the use of music to convey specific emotions that Hanslick so strongly objected to in romantic theory.) In his later operas Wagner's orchestra dwarfs into insignificance his actor-singers and the stage. His actor-singers lose their songs to the orchestra, cease to be interesting as individual character-studies, and become symbols of the universal love-death (*Liebestod*) struggle in nature. These Wagnerian attempts at a universal art work were thus successful only within limitations and his last operas marked the death of the romantic conception of a universal art object. Berlioz also sought to develop a universal art work in his "drama without voices" which involved conversion of the symphony by assigning equal roles in the work to poetry and the instrumental parts. Whereas the idea of a universal artwork implies a unification of *all* the arts into one art object, the romanticists conceived of it primarily in terms of a unification of poetry and music. More often than not they left the problem of including the other arts in the universal art work to the realm of speculative theory.

Perhaps a closer approximation of a universal art work is to be found in some 20th cent. ballet productions in which music, scenery (stage included), and choreography (including mimicry and dramatic action) are brought together by contemporary masters of the arts involved. An example of this is afforded in the Monte Carlo Ballet Russe production of *Rouge et Noir* based on the novel by Stendhal and which involves the music of Shostakovich's *First Symphony*, choreography by Massine, and scenery by Matisse.

Past failures to achieve a universal art work are variously explained by aestheticians and musicologists. One of these is that any attempt to unify music with the other arts is destined to culminate in the swallowing up of the other arts by the music involved, esp. if the latter is "great" music. This is an unacceptable explanation because it presupposes a universal primacy of musical aesthetic sensitivity, for which there is at present no evidence. Another theoretical difficulty encountered in the notion of a universal art work is in discovering just what it is believed that such a work would achieve. It may be thought that the final universality of art can only be achieved by unifying the prod-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ucts of the various arts. But this would involve a misconception of the nature of universal art. The universality of an art object does not consist of the diversity and quantity of aesthetic sensibilities it might arouse as the result of combining it with other types of art objects, but rather, that universality is a function of the inseparable and indiscriminate integration of the form and matter of the particular art object in question. See MUSICAL PERFORMANCE, MAIN TRENDS IN. —H.G.S.

**unorganized.** This term is used very broadly in literary criticism with one general meaning that varies specifically as it occurs in different contexts. Generically, the term indicates that the parts of the literary work have not been successfully combined; that is, the work lacks structure and unity, because the elements have not been well molded into a whole. For the more important specific variants of the term, cf.: episodic, inchoate, verbose, obscure. —I.J.

**unprinted.** An area left "white" in a print process. See PRINTS AND PRINT PROCESSES.

**unrhythmical, rhythmical chant.** See JEWISH MUSIC.

**unrounded.** See edition binding.

**upbow.** *Mus.* The stroke of a bow in the direction "from point to nut".

**upturned roof.** See CHINESE ARTS.

**uraeus.** The representation of the sacred asp (in ancient Egyptian religion) on the headdress of rulers.

**urceus** (L.). A pitcher or jug with one handle.

**urn.** In Oriental art, a receptacle, varying in shape, for holding the ashes of the deceased. Applicable to a shape or form simulating a mortuary vessel, as, urn shape. See also ex libris.

**ūrṇā** (Skr.). Tuft of hair growing between the eyebrows; a definite mark of the Buddha. In Buddhist sculpture and painting it is usually represented as a sort of jewel on the forehead. In this form it is considered as a third, and divine, eye, indicating supernatural spiritual insight. —J.A.M.

**urushi** (Jap.). Sap, from the poisonous sumac tree, known as lacquer. See lacquerware.

**urushi-e** (Jap.). "Lacquer picture." The technique of painting with lacquer as a medium. See JAPANESE ART.

**U. S. A., LITERATURE OF THE.** In the transplantation of Englishmen from their native middle-class environment to the wilderness of the eastern coast of North America, the rude arts of survival took precedence over aesthetic enterprise. Although Michael Drayton speeded Raleigh's Company with an ode and although George Sandys translated a portion of Ovid while in Virginia, belles lettres did not flourish. With a howling wilderness to be subdued, with savage Red Men constantly on the war path as pawns in the persistent British and French colonial chess game seeking increased territory, and with a supernatural world of evil spirits ever waiting to tempt unwary souls, these first settlers had practical problems to face before there was leisure or education for creative activity apart from the beautification of their houses and tools. Yet these pioneers, sensing their formative part in the world's onward movement, prepared maps, drawings, diaries, and histories of their enterprises. John Smith (1580-1631), swashbuckling leader of the Virginia Company in 1607, wrote several narrative-descriptive accounts, such as *A True Relation* (1608) and *Generall Historie of Virginia* (1624); William Bradford (1590-1657) recounted "in a plain stile" the Pilgrims' crusading energy in *Of Plimoth Plantation* (1856); and John Winthrop (1588-1649) in *Journal* (1790, 1908) recorded in vigorous prose the social history of Massachusetts Bay from 1629 to 1649. The gay Anglican, Thomas Morton (1590-1646), enemy of the Plymouth Pilgrims, in *The New English Canaan,* 1637), denounced by Bradford as an "infamous and scurrilous book", wove a bright thread into the otherwise colorless historical writing of the colonial era. Only occasionally does the music of noble English prose of the early 17th cent. echo through these artistically barren structures.

Religious dissent gave birth to New England and Pennsylvania; economic enterprise established New York and the Southern colonies. Learning flourished only amidst heated theological arguments. The best prose emerged in sermon and polemic literature, some of it as fascinating in its baroque crabbedness as it is repelling in its chilling dogmatism. The most memorable 17th cent. prose writings are

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Roger Williams's anti-clerical and democratic *Blovdy Tenent* (1644), Nathaniel Ward's fiercely intolerant yet stylistically ornate *Simple Cobler* (1647), and Mary Rowlandson's pathetic tale of suffering during her captivity by Indians. Influential as an elementary textbook for a century was *The New-England Primer* (c. 1690), whose 64-page combination of prose tales of Protestant martyrs, Calvinist catechetical lessons, and mnemonic couplets adorned with crude woodcuts taught millions to read and spell.

Poetry in 17th cent. New England was largely elegiac and religious. Michael Wigglesworth (1631-1705) versified in jigging meters popular Calvinist dogmas in *The Day of Doom* (1662). Anne Bradstreet (c. 1612-1672) in *The Tenth Muse* (1650) echoed contemporary British poets like Sylvester and Quarles while revealing the comfort which religion afforded a sensitive person in a weary, wilderness land. Edward Taylor (c. 1660-1729), whose poems were first published in 1939, wrote notable devotional poetry in a metaphysical style.

New England's walls of religious conservatism did not prevent the infiltration of the free intellectual questing inherent in the new learning: Newtonian science, Lockean psychology, and deistic theology. In the 18th cent. Puritanism receded from its conservative Calvinist position steadily if unwillingly. Cotton Mather (1663-1728), foremost Puritan man of letters in America, reflected these new thoughts in some 400 publications which vary greatly in style: some retain the learned allusiveness and embroidered beauty of 17th cent. prose, and some imitate Addison and Steele's limpid clarity. His *Magnalia Christi Americana* (1702) is "the prose epic of New England Puritanism". Jonathan Edwards (1703-1758), often called the last great defender of Puritanism, combined a mystic's sensitiveness to spiritual beauty with a scientist's exactitude in examining, as he did at the age of 12, the web-making activities of a spider. He pictured the beauties of Heaven and the torments of Hell in sermons; one, "Sinners in the Hands of an Angry God," has been used to give an unfair, harsh interpretation to his character. *Freedom of the Will* (1754), his superbly reasoned defense of the tottering old order, remains one of America's most learned books.

One Boston boy migrated to Philadelphia in 1723, worked at the trade of printer, and by shrewd guarding of the main chance rose to be the most important citizen of Pennsylvania and one of the two or three most important in our Revolution. That lad, Benjamin Franklin (1706-1790), symbolizes the effect of the Enlightenment upon America. By escaping the repressiveness of Puritan New England and by establishing himself among freedom-loving, individualistic Quakers and German Lutherans, Franklin was able to expand intellectually as well as to grow rich and politically powerful. In youth he practiced the art of writing by imitating Addison. By becoming a master of the popular prose styles of the 18th cent.—letter writing, light essay, and satire—he gave powerful support to the colonists' protests against unwarranted invasion of their constitutional rights by Britain. A practical sociologist, Franklin initiated many civic improvements, including the establishment of a literary club, a library, and a school which later grew into the University of Pennsylvania. As a scientist he achieved world renown for experiments on electricity. In a day when "literature" meant "learning" Franklin towered above his fellows in reputation; for this reason, among others, he was received cordially in Europe and was successful as an ambassador in securing the aid of France and thus assuring victory in the Revolution. His proverbs in *Poor Richard's Almanac* (1733-1758) and the didactic, mildly self-disparaging *Autobiography* (1771-1789) inadequately represent Franklin's many-sided greatness as a man and a writer.

"Get John Woolman (1720-1772) by heart," counseled Charles Lamb, in speaking of the *Journal* of this pious Quaker tailor. More worldly was William Byrd (1674-1744), a philosophic Virginia plantation owner and author of frank records of colonial society phrased in sprightly style. Other memorable books are Sarah Kemble Knight's outspoken *Journal* (1825), an account of a trip in 1704 from Boston to New York, and Mather Byle's *Poems* (1744), unsuccessful imitations of Alexander Pope by a punning Boston parson.

In 1761 English mercantilistic colonial policy collided violently with American economic ambitions when an attempt was made to invade the privacy of business houses in a search for smuggled goods. James Otis repelled this aggression in a brilliant address; "Then and there the Revolution was born." As the British insisted upon taxing the colonists, learned constitutional lawyers, like John Dickinson and John Adams, spied in each action new threats to American self-respect.

"Taxation without representation is tyranny." Emotion replaced legalistic thinking. "Give me liberty, or give me death," declared Patrick Henry in 1775. Thomas Paine (1737-1809), an English Quaker who came to Pennsylvania in 1774, became the chief propagandist of the revolutionary party. In a pamphlet, *Common Sense* (1776), he painted King George as a bully, besmirched the concept of royalty, and affirmed the necessity for an independent nation. A prolific pamphlet warfare matched the actual cannonading. A state document, *The Declaration of Independence,* is the literary masterpiece of the era.

The problems of creating a new nation gave rise to *The Federalist* (1787-88), essays by Alexander Hamilton, James Madison, and John Jay, and to such books as Thomas Jefferson's *Notes on Virginia* (1787). The political nationalism of these volumes was matched by a cultural nationalism requiring American control of churches, and American manners, dress, language, art, printing, and literature. As early as 1770 John Trumbull, the poet, laid down the basic principle of nationality in literature. Other Connecticut men, especially Timothy Dwight in a patriotic song "Columbia" and Noah Webster in textbooks, essays, and *The American Dictionary* (1828), fostered national advancement. Philip Freneau (1752-1832), whose poetry combined harsh rabblerousing political qualities with sensitiveness to nature's beauty, asked for independence in strident verse; a few stanzas in the contemporary romantic manner make him the first memorable poet in the U. S. A. William Dunlap (1766-1839) prepared a few American plays, such as André (1789), but he suffered the common ailment of imitativeness in adapting or translating European plays. In fiction Hugh Henry Brackenridge (1748-1816) is remembered for *Modern Chivalry* (1792-1815), an amusing satiric commentary upon American aristocratic pretensions in the youthful democracy; and Charles Brockden Brown (1771-1810) still teases readers with unfulfilled promises in a half dozen melodramatic Gothic novels echoing Godwinian humanitarian sentiments.

Although the new literary theories of Wordsworth were not unknown to Americans, neo-classical conservatism marked literary efforts until 1815, when in Boston *The North American Review* was founded. The successful completion of the second war with England occasioned renewed enthusiasm for freedom, not only freedom in politics, but freedom in spiritual and artistic life. Unitarianism in Massachusetts gave further impetus to the separation of Church and State (completed in Conn. in 1817 and in Mass. in 1833); this liberal religious movement gave to the U. S. A. a whole galaxy of famous writers. Anti-slavery agitators demanded manumission of the Negroes in the United States. Philhellenists echoed Byron in requesting independence for Greece and for all small nations.

Washington Irving (1783-1859), a New Yorker, was the first American to win international praise for artistry in prose. A lover of the picturesque and marvelous, he used scanty plot materials as a framework for a heavily embroidered fabric of description and sentiment in the manner of Addison and Goldsmith. *The Sketch Book* (1819-20), written in England, contains "Rip Van Winkle" and "The Legend of Sleepy Hollow," two tales now classic. Lingering in Europe until 1832, he wrote on English, German, Italian, and Spanish themes; the best of these books is "the Spanish sketch book", *The Alhambra* (1832). Other New Yorkers, often called the Knickerbocker Group, include Fitzgreene Halleck (1790-1867), a poet; James Kirke Paulding (1778-1860), an essayist, novelist, and dramatist whose stylistic defects are compensated by bristling patriotism; and Nathaniel Parker Willis (1806-1867), gossipy essayist and traveler, poet, and dramatist. James Gates Percival (1795-1856), Connecticut poet and geologist, in 1821-23 published four voulmes of Byronic verse; for a brief moment his fame equalled Irving's. Slowly the merits of William Cullen Bryant (1794-1878) emerged; a Massachusetts man transplanted to New York as a newspaper editor, he wrote a few poems, but these maintain a uniform high quality in the Wordsworthian manner, as in "Thanatopsis" (1817-1821) with its organ-like musical reassurance that Nature bids us accept death stoically.

After a brief career at sea and as a gentleman farmer, James Fenimore Cooper (1789-1851) accepted his wife's challenge to write a novel. Following a feeble first attempt, he struck out vigorously in *The Spy* (1821), a tale of the neutral zone between the contending armies during the Revolution. With immense creative power he prepared The Leatherstocking Series, five novels tracing Natty Bumppo's career from a young scout to an old man leaving the East to retain his freedom on the western prairies. Thirty additional novels, a history of the U. S. Navy, and other volumes on politics and travel cas-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

caded from his desk. Chiefly known as a romancer employing the technique of pursuit and surprise, he also wrote solid studies of American manners and class conflict in *Satanstoe* (1845), *The Chainbearer* (1845), and *The Redskins* (1846). These realistic novels never achieved the popularity accorded the frontier tales. Cooper's numerous defects as an artist—hastiness, generalized description, wooden dialog, inability to create women characters—are counterbalanced by gusto, unflagging excitement, plausible invention even in melodramatic situations, and the inclusion in each story of stimulating general ideas. Balzac found the basis for his vast panoramic plan for a Comédie Humaine in Cooper's Leatherstocking Series.

Two titans of U. S. literature slowly attained in critical, if not in popular estimation their proper stature. Herman Melville, (1819-1891) sailed on whaling vessels as a youth. His earliest novels, *Typee* (1846) and *Omoo* (1847), recount with some imaginative invention his experiences in a cruise to the South Seas. During ten years he wrote nine novels, none of which really succeeded. He surrendered authorship and at his death was an almost forgotten customs clerk in New York City. *Mardi* (1849) began as a romance but turned fiercely satirical of western civilization in passages beclouded by allegory or impassioned rhetoric. *Moby Dick* (1851), one of the great books of the U. S. A., recounts a monomaniac whaling captain's pursuit of a white whale; the magnificent story, carrying a heavy freight of zoological information and philosophizing, is an allegory of man's inability to overcome evil. Melville moved steadily toward an extreme pessimistic, antidemocratic, anti-clerical position. Although much of his reasoning is sophomoric, his dithyrambic sentences roll and heave with the thunderous power of ocean waves.

The antithesis of Melville was Walt Whitman (1819-1892), who in his poetry shouted optimistically an affirmative mystical faith in the individual, in democracy, in universal brotherhood; he welcomed death as the inlet to immortal life; he gloried in the noble destiny of the United States, whose leadership in world progress was inevitable. He rejected no one as unworthy; he sang the female equally with the male. His incautious ascription of goodness to every part and function of the human body led Emerson to request the omission of "Children of Adam" from *Leaves of Grass* (1855-92). Whitman clung to his principles, each few years adding a new group to the old in an expanded edition of his book. Yet Walt was no uncritical optimist; his prose writings contain searching analyses of the shortcomings of the U. S. A. *Democratic Vistas* (1871) show Whitman's untutored groping for a solution. *Specimen Days* (1882), an autobiography, sketches Whitman's career as a journalist and government clerk. Whitman's rejection in his own day resulted from the novelty of his verse pattern—a long, surging, oratorical line of irregular length; the absence of narrative or simple lyric statements and of regular meter and of traditional poetic devices; the ejaculatory, dithyrambic nature of his utterance; the use of lists or catalogs of events, persons, or places; and the inclusion of strange words. The average reader desires in poetry a narrative, or a clearly discernible moral interpretation, or a humorous twist of language enforced by rhymes. Even yet Walt is a poet's poet; such a pure gem as "When Lilacs Last in the Dooryard Bloom'd", being very intricate in its intertwining of three symbols, is more often praised than understood. Immense has been his influence on later poets; he freed verse from the shackles of meter, and he gave experimenters fruitful suggestions about symbolism and verse structure.

The South and the Old Southwest utilized the tall tale (q.v.) pattern of humor in books descriptive of local scenes and characters. A. B. Longstreet's *Georgia Scenes* (1835) described gander pulling, horse swapping, and similar rural customs. J. P. Kennedy fathered the romantic Virginia plantation tradition in *Swallow Barn* (1832). Even Edgar Allan Poe (1809-1849) in minor tales employed comic extravagances, although few of his stories are localized. Poe, born in Boston and raised by a Richmond merchant, stands apart from the main stream of American letters by his emphasis upon the purely aesthetic aspects of literature. While others were moralizing, Poe demanded "the rhythmical creation of beauty" and harangued against the "didactic heresy". He made a reputation as a critic and editor; his short stories fixed the pattern for that form of literature; and he dreamed of fame as a poet. He worked best within the narrow limits of Gothic terror in fiction and elegiac sentimentalizing in lyric poetry. A half dozen poems, a dozen stories, and three or four pieces of criticism are imperishable; he was America's first true aesthete in literature. Pride, intemperance, and instability humbled and finally killed him;

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

he remains a dark, enigmatic figure like the raven in his celebrated poem. In Charleston, S. C., William Gilmore Simms (1806-1870) wrote poetry, fiction, history, and political essays; his Cooperlike frontier and historical novels surge with turbulent action and boisterous humor. Henry Timrod (1829-1867) phrased eloquently in a few poems the Southern nationalist ideal in the War between the States. In this conflict numerous songs achieved high poetic beauty, such as Albert Pike's "Dixie" and J. R. Randall's "Maryland! My Maryland."

In New England dawned a Golden Day in literature, a day enriched by noble sentiments in accord with reform aspirations in every area of human endeavor. Most popular and even accorded a niche in Westminster Abbey was Henry Wadsworth Longfellow (1807-1882), whose sweet, moralizing lyricism tunefully embodied a gentle melancholy, and whose narratives of Evangeline, Miles Standish, and Paul Revere have molded U. S. concepts of certain historical events. Longfellow's seemingly fluent simplicity hides delicate artistry and sensitive perceptivity; his management of music, even if borrowed, and of figures of speech shows true poetic craftsmanship. His ideas, such as his pacifism in "The Arsenal at Springfield," reflect the best taste of his generation. The "Divina Commedia" sonnets belong with the greatest in the language. With more certitude in religion but with less artistry, John Greenleaf Whittier (1807-1892) pictured the simple, rustic beauty of New England scenery and the daily duties of common people. A Quaker, he phrased his people's humanitarian faith in terms now generally acceptable to all Christian sects. His dozens of anti-slavery poems have been forgotten, but still remembered are "Snow-Bound" (1865) and a few Burns-like pictures of New England life, as well as his religious lyrics.

The reforming zeal of New England caught up James Russell Lowell (1819-1891), whose early essays and poems questioned the necessity for human poverty, advocated abolition, and denounced the imperialistic aims apparent in the Mexican War. *The Bigelow Papers* (1847), dialect verses, gave literary sanction to this form of expression and paved the way for local color (q.v.). After the death of his wife, 1853, he turned literary critic and in studies of famous continental authors submerged his talents during the weaving of the civil crisis. In old age, as a minister to Spain and England, he became an outspoken defender of the democratic tradition. A few verses remain memorable; the heavy, essay-like odes and the elaborately jeweled prose criticism lack survival qualities. Perennially amusing are several light verses by Oliver Wendell Holmes (1809-1894), surgeon and man of letters, who typifies the finest qualities of the Brahmin caste of New England; faded now are the breakfast table conversations, the fiction directed against the enemies of the new science, and the biographical sketches of his contemporaries.

Two New England minds remain fresh and stimulating in spite of a century's changes. Ralph Waldo Emerson (1803-1882) and Henry David Thoreau (1817-1862) were fellow townsmen in Concord, Mass. The elder had come by way of Harvard College and Unitarianism to the conclusion that "The highest revelation is that God is in every man." Self-reliance, therefore, becomes God-reliance, and man's duty is to trust the Spirit of God radiant within all nature and within himself. This mystical belief informs almost every one of Emerson's writings; seldom has an author devoted so many different compositions to the elaboration of a single theme. In meditative and lyric poems Emerson's ideas are highlighted by apt imagery; the essays are prose poems employing all the artifice of verse. *Essays* (1841, 1844) is one of America's great books. Emerson's power arises from intensity of faith and verbal dexterity. Aphorisms stud his paragraphs like jewels. Short sentences, abundant figures of speech and allusions, and a public speaker's willingness to startle an audience with unexpected words—these are some of the elements of Emerson's art. As a critic be subordinated literature and art to ethical ideals, distinguished between talent and genius by discovering in the latter the always necessary God-reliance. The orotund universality of his utterance is difficult to translate into foreign tongues; yet his work is the least tarnished by time in the whole realm of American literature. Around Emerson gathered the so-called Transcendental Club, a dozen forceful Unitarian preachers and several energetic women like Margaret Fuller and Elizabeth Peabody.

Emerson's handyman and gardner, as well as Concord's pencil maker and surveyor, was Henry David Thoreau, who came into this world, he said, "not chiefly to make this a good place to live in, but to live in it." An individualist, he desired to live free and uncommitted, unhampered by any institution.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

This doctrine he phrased in *Walden* (1854), one of the great books of the U. S., the discursive account of his experiences while living as a hermit, and an ethical teacher's appeal to society to return to simplicity and elevated feelings by living close to nature. Mahatma Ghandi, the Hindu nationalist leader in India, carried Thoreau's "On Civil Disobedience" (1849), a brief explanation of the political theory of non-cooperation. Unlike Emerson, Thoreau lacks constructive power in the organization and phrasing of his thoughts. Yet many aphorisms and many poetic passages adorn his several books.

The rise of the public school system after 1834 and the spread of education played its part in creating a vast reading audience. Gift books (q.v.), beautifully printed annuals, circulated in large numbers. Fiction lost something of the stigma attached to it, although novels and plays were still considered artifices of the devil. Fiction became increasingly popular; between 1789 and 1850 no fewer than 1500 novels were published. The master craftsman in fiction was the anatomist of sin-haunted minds, Nathaniel Hawthorne (1804-1864), a descendant of a witch-hanging Puritan judge. After study at Bowdoin College, he retired to his attic room to write, burn, and rewrite for a dozen years. *Fanshawe* (1827), a slight novel, was withdrawn from sale and burned. Year by year Hawthorne wrote a few stories which satisfied his high standards; in 1837 he culled a dozen for *Twice-Told Tales,* which was enlarged to 39 in 1842. Poe greeted the second collection with a review in which were laid down the laws of the short story and in which Hawthorne was pronounced "original on all points." *The Scarlet Letter* (1850) immediately was recognized as a masterpiece and still is considered America's finest piece of long fiction. This story of a woman's heroic maintenance of self-respect after being publicly punished for adultery has all the intensity and beauty of a Shakespearian tragedy. A thread of romance brightens the melodramatic *The House of the Seven Gables* (1851), which manages also to contrast the aristocrat unfavorably with the democrat in American life. Hawthorne's uniqueness lay in his ability to focus upon single incidents, such as that in "The Gray Champion," until a universal interpretation emerged. Like Poe he succumbed to contemporary taste for terror stories, but he never descended to hoaxes and extravaganzas. A uniform high seriousness, often balanced with humor, marks his concern over the sins of mankind. Although his popular appeal is small compared with Poe's, Hawthorne's quiet artistry, as in "Rappaccini's Daughter," knew no equal before his time.

Five dramas still sparkle with vitality: J. N. Barker's *Superstition* (1828), picturing a bigoted Puritan parson's unrelenting hostility to two non-conformist strangers; R. M. Bird's *The Gladiator* (1831), based on the slave rebellion in Rome led by Spartacus; N. P. Willis's *Bianca Visconti* (1837), a story of an Italian girl's murder of her brother to enthrone her husband; Anna Cora Mowatt Ritchie's *Fashion* (1845), a comedy of manners satirizing the nouveau riche; and G. H. Boker's *Francesca da Rimini* (1855), a superb poetic version of the tragedy of Paolo and Francesca.

The conflict between the manufacturing interests of the North and the agrarians in the South seemed unimportant compared with the controversy over the manumission of Negro slaves. Statesmen like John C. Calhoun and Daniel Webster set forth the opposing sectional views in legislative debate. The issue remained doubtful in the public mind until Harriet Beecher Stowe (1812-1896) clarified the problem in a sentimental, melodramatic novel, *Uncle Tom's Cabin* (1852). With unprecedented rapidity the book circulated throughout the North; in vain a dozen fictional answers were prepared. Slavery was doomed. When conflict flared, a mood of grim determination marked both sides. Few of the writings, other than several songs and E. E. Hale's "The Man Without a Country" (1863), are as memorable as Abraham Lincoln's "Gettysburg Address" (1863), possibly the best prose-poem on democracy yet written, and "The Second Inaugural Address" (1865) with its humane last paragraph, bebinning "With malice toward none, with charity for all."

The Civil War accentuated the alterations transforming the U. S. A. from an agricultural to a manufacturing nation, from a people of independent mind living on farms to industrial workers huddled together in company towns or cities. The westward migration afforded an outlet to farmers, but free land became exhausted in 1892. The frontier shifted from within to without the nation. Imperial plans led to an interest in the Pacific Ocean and the acquiring of Alaska and the Philippines, an act whose importance would be clear forty years later in Japan's attack on December 7, 1941. Possibly in no

other nation had religious sanction seemed so necessary to its major policies; at home and abroad missionary societies spread a humanitarian "law of love," pictured well in C. M. Sheldon's novel *In His Steps* (1896), which sold more than 20 million copies. Public high schools in every community replaced academies, and state universities with federal support outdistanced private institutions. Government increasingly controlled business, so that by the 1930's in the depth of a depression socialistic schemes became increasingly popular.

Literature reflected these social changes, and literary theory tended to phrase social concepts rather than aesthetic principles. Pre-Civil War literature in the U. S. A. was primarily romantic and escapist; post-War writings reflected a realistic approach, which became modified after 1900 by the imposition of sectarian or social ideologies. Elbowing the older New England generation of writers from the scene were self-educated westerners. Bret Harte (1836-1902) electrified the nation with a humorous verse, "The Heathen Chinee," and short stories, "The Outcasts of Poker Flat" and "The Luck of Roaring Camp." With a new technique of realistic presentation based upon tall-tale humor Harte pictured the strange goldfields of California and their agglomeration of wicked gamblers, thieves, and prostitutes who retain a spark of goodness which lights up in a moment of stress. William Dean Howells (1837-1920) in reviews and books denounced romance and praised realism, in his case really a genteel fictional comedy of manners; in nearly a hundred volumes of novels and plays he pictured aspects of Eastern U. S. Following Harte's model and aided by Howells's criticism, dozens of authors described whimsical persons in a unique regional atmosphere in local color (q.v.) stories. Most famous of the Western writers was Samuel Langhorne Clemens, "Mark Twain" (1835-1910), whose tall-tale humor finds joyous outlet in *Roughing It* (1872), an account of the Nevada silver rush, and in three books on the Mississippi River, *The Adventures of Tom Sawyer* (1876) and *The Adventures of Huckleberry Finn* (1884), two delightful picaresque, episodic extravaganzas of boy life, and *Life on the Mississippi* (1883), an autobiography of his boyhood enthusiasms. A strain of pessimism in *The Mysterious Stranger* (1916) gave rise to the untenable theory that Clemens had suffered from repression. Clemens' exuberant anecdotal humor and perceptive descriptive skill were employed to further social justice and to secure equality for all men.

Henry James (1843-1916), born in New England but schooled in Europe, first insisted that fiction is an art; he taught dozens of writers, including Joseph Conrad and Edith Wharton, the principles of narrative structure. The inventor of the novel of international contrast, he developed psychological analysis of motive beyond that of his predecessor, Hawthorne. Hamlin Garland (1860-1940), born in Wisconsin, revolted against Eastern fictional romanticism in *Main-Travelled Roads* (1891) in an effort to improve the conditions of farmers in line with the ideas of the single taxer Henry George and of the Populist Party; his doctrine was labeled vertism (q.v.). Stephen Crane (1871-1900) in verse and prose transferred to literature the new French aesthetic theory of impressionism (q.v.); *The Red Badge of Courage* (1895), a novel, pictures a soldier's responses to war. Theodore Dreiser (1871- ) in *Sister Carrie* (1900) set off a bombshell with a story of a wayward girl whose actions were excused in accord with the conclusions of materialistic naturalism (q.v.). For thirty years Dreiser's extreme frankness typified all that was hateful in the new realism. With the rise of the magazines as purveyors of advertising to millions of readers, fiction became the most important form of literary expression. William Sidney Porter, "O. Henry" (1862-1910), created brittle, slangy, ironic stories with undisguised compassion for the submerged masses, while Jack London (1876-1916) fictionized the theory of the survival of the fittest in tales and novels, many set in the Yukon. Upton Sinclair's *The Jungle* (1906) brought the stench of meat packing plants to public nostrils. With Sinclair Lewis's *Main Street* (1920) realism became enthroned, and thereafter, partly because of the mood of national self-disparagement created by World War I, dozens of novelists poked probing fingers into every area of human action. Yet as fiction increasingly became synonymous with the sociological tract, aesthetic experimentation flourished. Willa Cather (1876- ) not only asked Middle Western immigrants to find happiness in a life of disciplined endeavor close to the soil, but she demanded in an essay, "The Novel Demeublé," that the novel be stripped of its unnecessary trappings of description and commentary. Edith Wharton's *The Writing of Fiction* (1925) asked, as did James, for tightness of construction in traditional methods and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

for attention to moral values. The new barbarism, so called by conservative critics, was popularized in the short stories and novels of Sherwood Anderson (1876-1941), an awakened dreamer who reported the crudity and yearning of people unable to express their feelings. By employing the results and some of the techniques of Freudian psychology, esp. in *Winesburg, Ohio* (1919) and *Dark Laughter* (1925), Anderson opened to fiction writers Pandora's black box of subconscious mental activity and its devastating effects upon repressed individuals. The method of stream-of-consciousness affected almost all novelists; possibly the best single novel in this form was Conrad Aiken's *Blue Voyage* (1927). Yet naturalism had new areas of degeneracy to survey in the Deep South, where are set William Faulkner's stories of rape, lust, and brutality, and Erkine Caldwell's photographic reproductions of sharecroppers' moral decay.

In Ernest Hemingway's stories of war, racketeering, and bullfighting, the method of impressionism achieved new intensity. Yet it was John R. Dos Passos whose experiments seemed most fruitful, especially in the discontinuous technique of the movie news reel in *Manhattan Transfer* (1925) and in the successful rendering of the total social and intellectual impact of a moment upon a set of fictional characters, as in *U. S. A.* (1932-1938), through the use of four types of material in alternating chapters of narration, thumb-nail biographical sketches, quotations from newspaper stories and from popular songs, and a shorthand autobiographic record of the author's emotions. New depth of character insight as supplied by realism and psychology, coupled with an awareness of folklore and folk arts, gave the fictional practitioners of the New Regionalism (q.v.) attractiveness in recording local scenes and characters. Experimental fiction in the 20th cent., in advancing from timid realism to a full representation of every aspect of life, tended to come under the influence of the dogmas of socialism, communism, and naturalistic materialism. Yet such popular authors as Booth Tarkington and Dorothy Canfield Fisher, as well as most magazine writers, surrendered reluctantly, if at all, fiction's ancient romantic subject matter and traditional form.

Poetry after the Civil War, except from 1912 to 1920, became an art studied in the schools, practiced vigorously by many writers, but seldom supported by the public. Whitman remained unrecognized while the early New England poets' verses were memorized in every school. Bayard Taylor in "Bedouin Love Song" unconsciously symbolized the romantic escapism or exoticism of U. S. poets. Bret Harte and John Hay wrote a few local color verses, and James Whitcomb Riley (1849-1916) penned Hoosier nature poems and versified common sense. Joaquin Miller (1841-1913), a Byron of the Rocky Mountains, gave a few rhetorical yet perceptive word paintings of the pioneers' westward movement. Sidney Lanier (1842-1881) combined professional musicianship with poetry; like Poe he tried to wed the two arts. A nationalist and a humanitarian, he cried out against the materialism of the raven days of Grant's Administration in a plea, especially in "The Symphony" and "Corn," for the establishment of universal brotherhood. William Vaughan Moody (1869-1910) in "Ode in a Time of Hesitation," bitterly denounced the imperialism evidenced in the taking of the Philippines, but Richard Hovey (1864-1900), poet laureate of an American college fraternity, insisted in "Unmanifest Destiny" upon the doctrine that fate guides our nation's expansion. Whitman's prophet bard had not emerged; only an occasional poem reflected the national will or duty.

In 1912 in Chicago, Harriet Monroe (1860-1936) founded *Poetry: A Magazine of Verse,* seemingly just another little magazine (q.v.). Yet in these pages appeared a startlingly new poetry, a poetry which at last had come to grips with life and with the technical problems of poetics. Amy Lowell (1874-1925), sister of Harvard University's president, flamboyantly announced the arrival of a new era in poetry, espoused Imagism (q.v.), and put discussions of poetry upon the front pages of newspapers. Free verse (q.v.), the medium of the "new poetry," became the center of a public squabble. Vachel Lindsay (1879-1931), a modern troubadour who traded rhymes for bread on cross-country walks, phrased in a raucous manner, borrowed equally from jazz and from the Salvation Army, a set of pious, moralizing, patriotic, humanitarian ideas; he created poem games, rewrote Biblical narratives, and characterized politicians and movie queens in an effort to bring chanted poetry into each person's daily experience. His utopian dreaming first took form as the New Localism (q.v.). Carl Sandburg (1878- ) in a free verse akin to Whitman's has run the gamut of moods and experiences; his slangy word pictures of disgust, deceit, envy, and pride among poor

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

people startled traditional critics. Yet Sandburg continued to be the people's poet, as in *The People, Yes* (1936), possibly America's best imaginative exposition of democratic principles. A symbolist and an imagist, Sandburg has had the originality to use the steel mill and industrial civilization as the setting for his commentaries upon man's struggle and as a background for his faith in human striving.

Edwin Arlington Robinson (1869-1935), drew upon his New England home community for a set of characters whom he pictured as always failing. "Laureate of failure" he was once called, but Robinson clearly demonstrates that God is always at hand to help and that men are not fools by compulsion so much as through some flaw or weakness in character. Similarly transcendental in outlook but affirmative in his characterizations, Robert Frost (1875- ) uses New England scenes with which to universalize a sense of human brotherhood and to oppose theories or doctrines, such as materialism or self-interest, by which men are placed in hostile opposition. Both Robinson and Frost write almost solely in traditional metrical forms, yet their work differs greatly. Robinson is best in brilliant phrasing, subacid humor, ironic situation, and character delineation; Frost is supreme in conversation-like descriptions, wherein seemingly unobtrusive details supply clues to intentional allegory and a universal interpretation.

French symbolism gave direction to Thomas Stearns Eliot (1888- ), whose *The Waste Land* (1922) aroused a furore because of its metrical novelty and its mood of despair and frustration. Eliot's radical experimentation involves the seemingly incongruous mixture of trivial and important, traditional and experimental words, figures, and statements; yet his musical lines suggest his moods even when the words, drawn in part from many foreign languages, may not be clear. Eliot's influence on later poets has been immense. Conrad Aiken (1889- ) is heir apparent to Poe and Lanier as a musical poet; his delicate efforts to evoke rather than to portray Eliot-like moods have limited his audience. Robinson Jeffers (1887- ), Whitman's antithesis, draws from scholarly study a negative philosophy which holds that civilization is a transient sickness and that man is doomed to defeat. His long-lined free verse differs greatly from Whitman's and Sandburg's in its failure to make the line a phrasal entity. In an epic of the Civil War, *John Brown's Body* (1928), employing many meters and including fragments of prose, Stephen Vincent Benét (1898-1943) proved that poetry still speaks to the average reader; in other poems Benét has phrased the terror and impact of the totalitarian threat to liberty. Recent experimentation in verse has tested every possible alteration to rhythm and cadence, lineation and structure, and verbal effect through sound and suggestion.

Among the traditional poets three women have gained high place. Sara Teasdale (1884-1933) with bright clarity pictured in love poems a woman's slightly cynical or disillusioned feelings. Elinor Wylie (1887-1928) counseled an aloofness to the struggles of the marketplace; her patrician mood is found in a small collection of exquisite poems. Edna St. Vincent Millay (1892- ) sprang to fame as a college student with "Renascence," a remarkable poem describing a mystical experience; her later work has dealt with death and love in traditional meters or has excitedly opposed tyranny and repression in free verse.

From 1865 to 1915 the American theatre suffered colonial dependency upon Europe because the theatrical chains and managers looked for financial profits rather than artistic success. After 1883 vaudeville (q.v.) and stock companies created theatres or so-called opera houses for every city; in 1910 there were 1,520 legitimate theatres in the U. S. A., but fifteen years later the number had fallen to 634 and continued to fall. Partly because of a "star system" and chain management, drama in the U. S. A. imitated French well-made plays. Occasionally the influence of Ibsen appeared: yet the more famous authors, Augustin Daly, Bronson Howard, Augustus Thomas, Clyde Fitch, and David Belasco, used rapid-fire melodramatic effects in modified comedies of manners. Dramatizations of popular fiction and adaptations of foreign plays largely filled the stage, although an occasional play, such as Clyde Fitch's *The Truth* (1907), W. V. Moody's *The Great Divide* (1909), or Margaret P. Peabody's *The Piper* (1910), hinted awareness of the new spirit rising in the European theatre. With the formation in 1912 of the 47 Workshop by G. P. Baker at Harvard University and in 1915 of The Provincetown Players and the Washington Square Players, experiment and native authorship received new impetus. The vogue of the Little Theatre movement (q.v.) gave opportunities to actors and writers who were

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

denied expression when the commercial theatres closed.

Eugene O'Neill (1888- ), the single internationally important figure in contemporary U. S. drama, began with Baker and the Provincetown Players. Combining realistic and romantic techniques while utilizing the results of modern psychological research, O'Neill has become notable for delineation of character through the evocation of feeling, dramatic experimentation with Strindbergian expressionistic techniques, and facility in giving universality to isolated incident. His most striking dramas include *The Emperor Jones* (1920); *The Hairy Ape* (1922); *The Great God Brown* (1926) with its experimental use of masks; *Strange Interlude* (1928) with an elaborate use of subvocal speech in stream-of-consciousness asides in a 9-act treatment of repression; and *Mourning Becomes Electra* (1931), a trilogy on the Electra theme reinterpreted with psychoanalytic insight into the effect of Puritan American attitudes. In *Lazarus Laughed* (1927) and *Days Without End* (1934) O'Neill gives affirmative answers to questions of religious faith and immortality. *Ah, Wilderness!* (1933) shows O'Neill's gifts as a comic writer.

Maxwell Anderson (1888- ) who alone rivals O'Neill as a serious dramatist, uses social themes for purposes of tragedy; *Winterset* (1935), a study in class conflict, in spite of flaccid verse has moments of greatness. Elmer Rice in *The Adding Machine* (1923), an expressionistic drama of the effect of industrialism, and Clifford Odets in *Waiting for Lefty* (1935), on trade unionism, best represent the rise of proletarian influence in drama. Even more effective in using the drama for social discussion was the W. P. A. Federal Theatre Project (1936-1939), which created a new dramatic form, the Living Newspaper, a combination of techniques derived from the radio, moving picture, and recent theatrical experimentation. Much regional activity resulted in a few excellent plays, esp. those of Paul Green and Dubose Heyward.

Although problem and social plays were numerous, especially upon the themes of the futility of war, of class hatred, and of the need for human brotherhood, the largest production continued in the field of comedy by such skilled artisans as Rachel Crothers, Clare Kummer, George Kelly, Philip Barry, George S. Kaufman, Marc Connelly, and Robert Sherwood.

Literary criticism, practiced incidentally by such writers as Poe, Howells, and James, became an art in the 20th cent. Van Wyck Brooks enunciated the need for a continuous flow of general ideas about an author and the evaluation of his work in terms of his social thought. Irving Babbitt and P. E. More created the New Humanism (q.v.), an ethical theory requiring authors to maintain a balance between extremes. H. L. Mencken skeptically examined all theories while demanding that authors tell the truth; his electicism as editor of *The American Mercury* (1923-33) gave critical support to dozens of new writers of all creeds and schools. Communism became the popular ideology of the 1930's; V. F. Calverton gave the most reasoned interpretation of the value of this Marxian concept. B. A. Botkin through essays and anthologies gave clearest expression to the concept of the New Regionalism. Under John Crowe Ransom a group of young Southerners developed an agrarian economics with a metaphysical poetics and a preference for T. S. Eliot's aristocratic traditionalism. Never before had literary criticism been as controversial or so lively.

The essay maintained its traditional forms during the remainder of the 19th cent. John Burroughs and John Muir perfected the nature essay of Thoreau, and many authors vied to become genteel commentators upon nature and man. Not to the mild, conservative Samuel McChord Crothers or to the acidulous Agnes Repplier does one turn today for a record of the times, but to the journalistic prose of Upton Sinclair, Stuart Chase, Walter Lippmann, and the newspaper and magazine columnists (q.v.). Fresh breezes blew the academic dust from U. S. prose when H. L. Mencken and G. J. Nathan founded the *American Mercury* and H. R. Luce *Time* in 1923. *The New Yorker* in 1925 completed the rout of traditionalism with well-bred sophistication in satiric sallies, biographical profiles, light verse, stories, and criticism of the arts and fashions.

Biography rose into a major art after 1920, when the biographical pattern of fiction seemed less important than swiftly told yet accurate interpretations of the major figures of world and American significance. W. E. Woodward coined the word "bunk," which served to denounce falsification of fact. His *Meet General Grant* (1928) was called a "debunking" biography. Washington, Lincoln, and other persons were subject to close analyses of actions and motives; the net effect was

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the discovery that biography might escape funereal solemnity and achieve the sprightliness of life itself. Carl Sandburg's 6-vol. study of Lincoln and D. S. Freeman's 4-vol. description of Lee, as well as 3 supplementary vols. on Lee's generals, have already achieved the status of classics. A vogue of autobiography has led to thousands of such volumes; Henry Adam's *Education* (1907) and Ludwig Lewisohn's *Upstream* (1922 attracted attention because of their exasperation at U. S. shortcomings.

Literature in the U. S. A. is concerned more with matter than manner, more with ideas than style, more with ethics than aesthetics. Yet not only does each new technical advance or aesthetic theory in the four quarters of the globe receive immediate trial, but U. S. writers now are in the vanguard of literary experimenters. In general excellence, if Nobel prizes be considered a criterion, the U. S. A. now has come of age, for the U. S. A. has had as many winners of this distinguished honor as any other nation. See R. Blankenship, *American Literature,* 1931; *Cambridge History of Am. Lit.,* 1917-21; V. L. Parrington, *Main Currents in American Thought,* 1927-30; P. H. **use zoning.** See CIVIC PLANNING.

**Ushaq carpets.** See ISLAMIC ART.

**ushnīsha** (Skr.). A protuberance or topknot on the skull of the Buddhas, always shown in painted or sculptured figures.

**usnīsa.** Cranial protuberance of the Buddha, signifying gnosis (knowledge of positive spiritual truth).

**uta-e** (Jap.). See JAPANESE ART.

**Utakawa yaki** (Jap.). Pottery made in province of Chikuzen.

**utilitarian, utility** (L. *utilis,* useful). A mode of *composition* (q.v.) in art, in which details are so organized as to be instrumental (or at least apparently or intentionally instrumental) to some end in the world of action which can be considered useful. Approximate synonyms are *functional, practical,* especially in contrast with *decorative, aesthetic,* etc. The utilitarian or functional factor in art is to be described in terms of fitness or intended fitness for some active use, beyond serving as an object for aesthetic or intellectual contemplation. In a work of art such as a chair, utilitarian or functional arrangements may coexist with decorative and other. These various factors may be merged (so that, for example, all decorative aspects are also utilitarian) or may be separate, as in applied, "non-functional" ornament. —T.M.

**U-T'ong, school of.** See SOUTHEASTERN ASIATIC ART.

**Ut-napishtim.** Hero of the ancient Babylonian deluge myth.

**vair.** See HERALDRY.

**vajra** (Skr.). So-called thunderbolt, generally a short double-trident form used in Hindu and Buddhist rituals and often shown as one of the attributes of a deity. See SYMBOLISM IN FAR EASTERN ART.

**Valencia ware.** See CERAMICS II.

**valley.** *Arch.* The internal angle formed by two inclined sides of a roof.

**value.** The term assigned by the Optical Society of America to the designation of relative brightness. It is used in this sense in the Munsell Color System as the designation for the lightness to darkness psychological attribute of color. See COLOR.
—V.K.B.

**valve.** *Mus.* A device for diverting the air-current from the main tube to an additional side-tube, in certain brass wind instruments. Because of the lengthening of the air-column the pitch of the instrument's entire scale is lowered.

**Van Dyke brown.** A painter's pigment said to have been named for the artist who liked a brown of that hue, this is a somewhat organic material coming from earthy substances like lignite or brown coal. It is partially soluble in oil and makes a transparent film; though it fades when exposed to strong light, it is more permanent in oil than in water color.
—G.L.S.

**vanishing line, v. parallel, v. point, v. point of diagonals.** See PERSPECTIVE.

**Vaphio cup.** See METALWORK.

**varada mudrā** (Skr.). A mystic gesture symbolizing charity in gift bestowing. Arm pendent, fingers extended, palm outward.

**vargueño** (Sp.). Writing desk.

**variance.** See CIVIC PLANNING.

**variation.** *Mus.* Repetition of a musical statement in which some of the characteristic features of the original statement are retained while others are omitted, or replaced by new features.
—E.K.

**variety.** See LITERARY CRITICISM.

**variety in unity.** Variety in unity or unity in variety is a universal and necessary mark of a satisfying artistic work. The problem needs a psychological approach. The function of variety is to intensify the spectator's interest, and the function of unity is to increase, by skilful organization, the range of factors which attention can grasp. (Pepper)

"Variety is the mother of enjoyment." Disraeli). Artful variety comprises all the means by which the artist enhances the vividness of his creations by multiplying and altering their elements. A work of art is too simple if it summons only an instantaneous glance and it is too complex if it uses up the spectator's energy of attention before he wins compensating satisfaction. When a barren form or a bewildering chaos requires painful and fruitless effort, it precludes aesthetic enjoyment, which is both free and pleasing. An enjoyable work needs enough complexity to invite exploration and not so much as to weary our limited powers of attention. Pleasing variety is a well balanced mean between the excesses of deadening monotony and maddening chaos.

The chief means of attaining variety in works of art are: (1) *In medium*: richness and variation of appeal in sense qualities. (2) *In form*: rhythms involving wide variations; contrasts whether asymmetrical or oc-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cult (psychic). (3) *In value or meaning*: development of a theme through wide excursions; richness in imaginative suggestiveness; dramatic conflicts; specialties of personal style. (4) *In the whole*: freshness or novelty at any level.

Thus variety means creative complexity, range, richness, and variousness, perhaps charm, within a well-bounded whole. By itself, however, variety does not guarantee aesthetic satisfaction. The presentation of a conglomeration of sprawling and straggling objects without inner ties is favorable to the jitters and guarantees ugliness. Variety needs its supplement of unities. Their function is dual: to bring measured and pleasing order into the parts, and to expand thereby the range of our grasp.

The basic ways in which a work of art may be unified are: (1) *In medium*: consistency of medium and of craftsmanship. (2) *In form*: regular rhythm; symmetrical balance; proportion; the representation of familiar things; the use of well known traditional schemes and scales of organization; and, in temporal arts, lawful progression and climax. (3) *In meaning*: dominance of one emotion, theme, or personality; coherence of poetic truth. (4) *In the whole*: clarity or simplicity as excluding irrelevant or nonfunctional factors; fitness or suitableness of all parts within the whole; consummatory individuality or harmony.

The skilful combination of the modes of variety and unity in artistic works is the principal source of our enjoyment of them. Satisfying variety with unity means sufficient complexity to sustain exploration and sufficient integration to hold the parts together in a comprehensible whole. To variety and unity respectively are due the qualities of vitality and repose which distinguish aesthetic response. The harmony we call beauty is a union of variety and order; it is diversity with integration, organic unity, satisfying individuality. See T. M. Greene, *The Arts and the Art of Criticism,* 1940; D. H. Parker, *Analysis of Art,* 1926; Stephen C. Pepper, *Aesthetic Quality,* 1937. —R.F.P.

**varnish.** Any protective coating laid over a paint or any film material used as a protective coating for sculpture and other objects is commonly called a varnish. As a rule, varnishes are principally resinous films with more or less oil added for strength and plasticity. Originally it is supposed that the word indicated a resin dissolved in an oil or mixed with it. —G.L.S.

**varnishing.** See RESTORATION OF PAINTINGS.

**vase** (L. *vas,* a vessel). The term *vase* denotes a vessel of many types and materials: esp. one that is ornamental or decorative in style. It is usual to define this term as meaning a vessel without a cover, the height of which is greater than its width. Greek vases included vessels for holding or carrying oil, wine or water; for mixing wine and water; for pouring or drinking wine; and for perfumes or ointment. See SYMBOLISM IN FAR EASTERN ART. —A.W.O.

**vase carpets.** See ISLAMIC ART.

**vase form.** Any vessel, small in size, with contracted neck and substantial foot or base.

**vat dyed.** Dyed with insoluble dyes formed on the fiber by oxidation.

**vaudeville** (from Fr. *Vau de Vire,* a locality in Normandy from which emanated in the 15th cent. popular humorous songs). A form of variety theatrical entertainment in the U. S. A. embracing songs, dances, dramatic sketches, monologues, acrobatic stunts, and specialty tricks, each of which is presented and announced as a separate performance. In England the nearest corresponding term is 'variety theatre' or 'music hall'; occasionally when a thread of plot unites the various performances the terms 'musical comedy' and 'revue' are used. Vaudeville originated in the U. S. A. in 1883 in Boston, Mass., as the Gaiety Museum, when Benjamin Franklin Keith exhibited a midget and a stuffed "mermaid." Other attractions were added, inculding the famous comedy team of Weber and Fields. By emphasizing skill and keeping the presentation morally clean, Keith attracted audiences of ladies and children. With Edward F. Albee as partner, Keith developed a chain of theatres, so that by 1911, the year of Keith's death, every important city had a vaudeville theater. Since the vogue of the motion picture, vaudeville has increasingly become a subordinate variety entertainment; many performers play in night clubs. Since 1935 the term vaudeville has seldom been used in popular speech. See E. F. Albee, *Encyclopaedia Britannica,* 1942, XXIII, 13: Douglas Gilbert, *American Vaudeville: Its Life and Times,* 1940. —H.R.W.

**vault.** (1) An arched roof. (2) A subterranean compartment.

**vehicle.** See medium.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**veil.** See COSTUME ART.

**velarium.** See amphitheatre.

**vellum.** There is no technical difference between vellum and parchment (q.v.). In some instances the former term has been applied to what is called uterine vellum, skins of new-born calves, kids, or lambs. Usually it is given to any fine skin used for writing or illumination. —G.L.S.

**vellum finish.** *Book.* A smooth finish on binding cloth.

**velour.** Any soft, napped worsted or woolen dress goods fabric heavier than flannel. Pile fabrics are often called velours.

**velvet.** A fabric with a thick, short, cut pile on the surface and a plain back.

**velvet carpet.** Velvet in the better qualities resembles Wilton in appearance, but has more possibilties in color. It does not have the structural quality of the Wilton, as there is no buried wool in the jute back and it is not made on a Jacquard loom. Only one yarn is used but this has to be of good quality and of the same grade throughout in order to take the various color dyes properly. The natural yarn is wound around a drum-like small edition of a Ferris-wheel. The strips of pattern paper are followed by a printer who watches a vertical line of square on the pattern. The first square may call for a green and the drum is set in the #1 stop on the brass rim of the drum. Then he releases a car of aniline dye, in wheat flour paste, which prints a stripe of green across all the threads on the drum. Following the pattern he prints stripes of this same color on the yarns across the drum wherever required by the little square on the paper. Changing the car for each color, he prints all the colors required for each square of the pattern.

The yarn is removed from the drum, the dye is set and the flour paste is washed out. Each yarn is wound on a separate spool and arranged in its proper order on the creel and drawn between two tapestry setters. They set the yarn every few feet and the pattern can actually be seen on the surface. The pattern as seen is elongated over three times its actual length in the finished fabric as it is shortened up by the pile wires in the weaving. Just yarn, which has been sized is used for weight and strength as a stuffer in this weave. It is also generally stained on the back. Although this is the cheapest of the weaves it requires the use of a high quality of yarn. Velvet is a comparatively inexpensive weave but the weave itself is highly durable. It can be woven seamless to 18 feet wide. —B.E.J.

**veneer.** A thin layer, as of wood or stone, upon a commoner or under surface. See plywood.

**veneered (revetted) architecture.** See ARCHITECTURE.

**Venetian glass.** See GLASS AND GLASSMAKING.

**Venetian red.** The differences among the red iron oxides are hard to describe. This is one of them and, although formerly the name was used for a natural pigment, it is now given to a calcined mixture of copperas and whiting. —G.L.S.

**Venetian school.** See ITALIAN ART.

**Venice turpentine.** One of the few balsams used directly in the arts is a frequent ingredient in painters' varnishes. It has been mentioned since the time of the Renaissance and has probably been in use since varnishes were first employed. It comes from the European larch and is collected chiefly in the Tyrol. —G.L.S.

**vent.** An opening, commonly small, for the passage of something, as air; hence, an outlet of any kind.

**ventilator.** In southwestern archeology: The term usually applied to the opening or passageway which led from the open air through or under the wall and into the chamber. The ventilator consisted usually of an exterior or outer vertical shaft, a horizontal tunnel or passage, and often an interior or inner vertical shaft. (Some archeologists believe the "ventilator" served to conduct air into the chamber while others are of the belief that the so-called "ventilator" was thought to be the entrance and exit of spirit beings.) —J.M.M.

**Venus.** Aphrodite.

**verbose.** Lack of organization with specific reference to the presentation of material. The term indicates that a work of art is far longer and more complex than is demanded by the matter it treats and the meaning it carries. To be verbose is to give several bad reports, which repeat and perhaps obscure

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

one another, instead of one good report which presents itself and retires. —I.J.

**verdigris.** An artificial green pigment, a normal acetate or one of the basic acetates of copper, this has acquired the comparatively modern name, verdigris (*vert de Grece*). It was known in ancient times and methods of preparing it from metallic copper by exposure to mermenting grape skins in vinegar are described by Theophrastus and Pliny. It is a reactive and unstable pigment, and more permanent colors have displaced it on the artist's palette. —G.L.S.

**vergo.** *Book.* The lefthand page of an open book.

**verification.** See PSYCHOLOGY OF ART.

**veritism.** A literary theory set forth by Hamlin Garland in *Crumbling Idols* (1894), demanding of western U. S. writers an individuality arising from local characteristics, freedom from past models and books, and the sincere utilization of the present experience of honest, wholesome people. In modifying the prevailing emphasis upon local color (q.v.) in literature, Garland followed the leadership of William Dean Howells in demanding a realistic treatment of life and of the new sociology emerging from the study of natural science. Since evolution or natural law had created a new science, there should be a new art. The revolt was directed largely against the literary domination of the East, where most publishing houses and magazines were then located. —H.R.W.

**vermilion.** Both natural and artificial sulphides of mercury are called vermilion. The former, cinnabar, is now no longer used as an artist's pigment and probably was displaced to some extent in the Middle Ages. It is a mineral widely distributed, occurring in England, Europe, China, Japan, Peru, Mexico, and Spain. This and the artificial oxide of lead were the bright orange-red pigments of antiquity. An Arabian alchemist in the 8th or 9th cent. speaks of a red pigment produced by the union of sulphur and mercury, and from that time on recipes for such preparation are common in the literature of painting and craftsmanship. There is little difference between the artificial and the natural pigments, although the former seem to have a somewhat higher intensity of color. —G.L.S.

**verse anthem.** See anthem.

**vert.** *Her.* Green.

**vertical.** *Mus.* Term used figuratively to designate the simultaneity of musical elements, particularly the formation of chords.

**vesi'ca.** In art a lenticular shape formed of two equal circle arcs each passing through the center of the other. Used in early Christian art as the traditional panel for a standing figure of Christ or an Apostle, in heraldry as the escutcheon of a churchman's arms. It is the usual shape of the seals of bishoprics and priories. In architecture it is known as **vesica piscis** from its original use in symbolic ornament as a cartouche holding a fish. —T.E.F.

**vestibule.** A small room or antechamber, usually between the outer entrance and an interior doorway to a larger chamber.

**vibrato.** The vibrato is the most important of all the musical ornaments on account of the extent of its occurrence and the essential characteristic which it contributes to tone quality in the form of flexibility, tenderness and richness of tone.

There are several reasons why this aspect of music has not been understood, explained, or properly appraised by musicians. One obstacle has been that, until recently, there was no measuring instrument available for accurate recording and scientific analysis of the phenomenon. Another obstacle is the fact that the vibrato as we hear it is entirely different from the vibrato as it is performed. We now have the means by which it may be recorded and analyzed into the minutest detail.

On the basis of laboratory experiments, we are now in a position to offer a definition which is subject to critical examination and verification in the laboratory: *A good vibrato is a pulsation of pitch, usually accompanied with synchronous pulsations of loudness and timbre, of such extent and rate as to give a pleasing flexibility, tenderness and richness to the tone.* (See ACOUSTICS, TERMINOLOGY IN.)

This is a definition of a *good vibrato*; but vibratos may be good, bad, or indifferent. In general, we may say that a *bad vibrato* is any periodic pulsation of pitch, loudness, or timbre, which, singly or in combination, fails to produce pleasing flexibility, tenderness, and richness of tone. Likewise, if we desire a *generic definition of all vibratos,* we might say that the vibrato in music is a pe-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

riodic pulsation of pitch, intensity, or timbre, singly or in combination.

This definition is a result of years of experimentation, and tells a long story. It identifies the media through which the vibrato may ocur, showing that there are three distinct kinds of vibrato, namely: *pitch vibrato, intensity vibrato,* and *timbre vibrato.* The first two may occur singly or in combination. On the basis of the analysis of musical tones, we are in a position to say that these three can be isolated and demonstrated, and that they are the only kinds possible because they cover all possible basic attributes of sound waves.

The second part of the definition describes its function, namely: to give a pleasing flexibility, tenderness, and richness to the tone. These three aspects are universally recognized in musical aesthetics as desirable and fundamental. Each holds a distinct and definable place in any psychological classification of the expression of feelings.

The average pulsation in pitch for all the best singers of today is about a semitone step in *extent* at the *rate* of six-and-a-half cycles per second. The *intensity vibrato* is, as a rule, present in parts of the tone, but is not conspicuous in a good tone. Where it occurs, it tends to be at the same rate as for the pitch and between two and three *decibels of intensity* in extent. The pitch vibrato is present in every good tone, long or short, and in all the transitions.

By collecting musical *performance scores* for adequate samplings of singers under all sorts of conditions, we can build a veritable *science of the vibrato,* which, when it becomes a matter of popular knowledge among musicians, will probably be treated as a common-sense knowledge. Here, we can mention only a few things about the occurrence of the vibrato and its true nature.

In singing, the pitch vibrato is practically universal. No good artist sings without it. It occurs not only in long tones, but in short tones, attack, release, and portamento. It tends to come in gradually in the voice of the child, just to the extent that the child sings with genuine feeling. It occurs in the most primitive races, wherever the intonation is of an emotional nature. It occurs in sustained and emotional *speech*; and in very hearty *laughter* of the adult. It is present in the vigorous *crying* of the newborn infant, in the singing of the *canary,* in the *bark* of the dog, in the *cooing* of the dove.

In short, it is present wherever sustained vocalization expresses genuine emotion. It is a basic phenomenon of nature, both in man and in higher animals. It rests fundamentally upon the periodic innervation of paired muscles under emotional tension. The *canary* bird in the simplest tour has a mere chatter in one pitch at the rate of six or seven pulsations per second; in fact, all the recognized tours of that bird may possibly be traced as embellishments upon this basic time pattern, through modulations of pitch and increasing complexity of rhythmic pattern in time and intensity and timbre.

The same principle applies to man. We are born with the neuro-muscular organism which has a number of natural periodicities. One of these is at the rate of from five to ten pulsations per second and is probably a phenomenon of what is known as *refractory phase*; which means that it requires a certain time after one nervous discharge into a muscle before the next discharge can become effective. The "ha-ha-ha" in a most hearty laughter at the rate of six or seven pulsations per second is a basic illustration of this phenomenon; and the corresponding chatter may be heard in vigorous crying.

On this basic time pattern the human vibrato, both of pitch and intensity, tends to take the form of a *sine curve*; partly on the ground of the natural ease of this type of pulsation, and partly because that form is most pleasing to the musical ear. The reason that the vibrato is present in that type of bodily tension which is characteristic of emotional expression is that it is actually a form of trembling. In good music this is so modulated that it lends beauty to the tone.

All instrumental vibrato is undoubtedly an imitation of the vocal. The *violinist,* for example, aims to give the tone the richness, tenderness and flexibility characteristic of the voice; but in this imitation or voluntary production of the vibrato, he improves upon the vocal because he has a better control of the tone. He is, therefore, able to make it even more pleasing to the ear, usually by holding down the extent of the pulsation to a quarter tone step as opposed to a semitone in voice. The vibrato occurs not only in the bowed stringed *instruments* but possibly in all the orchestral and band instruments, although not to the same degree of pulsation or so conspicuously. In the clarinet, for instance, it is seldom recognized in hearing but phonophotography almost invariably reveals it in beautiful clarinet tones, especially in solo

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

parts. Sometimes it is a pitch vibrato, sometimes intensity, but usually both, and there is nearly always a timbre vibrato present.

In certain instruments a particular kind of vibrato is produced by mechanical devices; as, for example, the tremolo or the *voix celeste* in the organ. In fixed instruments, such as the piano and organ, there are various devices by which the vibrato may be produced through sympathetic vibrations and other means. The sympathetic vibration in the violin often results in a conspicuous intensity vibrato.

The significance of the conception here presented is of far-reaching consequence in music. It recognizes the organic basis for a trembling in tone production. This trembling is evidenced in the *tonal,* the *dynamic,* the *temporal* and the *qualitative* aspect of the tone. The term vibrato is generic: scores of kinds of vibrato may be designated in terms of specific characteristics for which we now have names. To the singer it is not a question as to whether or not he shall use the vibrato; the question is, What kind is to be *cultivated* and *tolerated*?

*Beauty in the vibrato* is found in *artistic deviation* from the precise and uniform in all the attributes of tone. It is the most systematic, natural, and essential of musical ornaments. Its beauty lies in its contribution to the flexibility, the tenderness, and the richness of the tone as opposed to the thinness, the rigidity, and the coldness of a tone. It represents the periodic changes of pitch, intensity, and timbre in *sonance.* Richness of tone results from *successive fusion* of changes of tone as distinguished from simultaneous fusion in timbre. *Flexibility* of tone results from indefiniteness of outline. Tenderness of tone results from evidence of organic trembling. The genuine vibrato is automatic and expresses the truth, like the smile and the frown. To cultivate the vibrato, one should not cultivate a sign of feeling which is not present, but cultivate the power to feel music genuinely.

In ordinary listening we hear many more bad vibratos than good ones. We find evidence for the *desirability* of the good vibrato from many sources, among which we may mention the following:

*The Universality of Its Occurrence in Good Singing:* No singing can be good without the vibrato except for an occasional contrasting effect. Objective measurements reveal its presence often in the most desirable form where the singer denies its use, and the musical listener has failed to hear it as such. If any recognized musician thinks he can find one exception to this rule, it is his duty to document it by making an objective recording and publishing the fact. The issue involved is a vital one for good music, but it is greatly confused in most current theory and practice.

*Its Automatic Nature:* The fact that the vibrato in voice occurs automatically whenever the person sings with genuine feeling indicates that it is an inherent mode of expression in the *aesthetic mood.* Like the smile and the frown, it is an organic, natural, and true expression of feeling when genuine. It can, of course, be imitated and learned, just as a smile and a frown can be acquired; and to that extent it is an imitation of feeling.

*Its Use in Instrumental Performance:* The fact that the violinst cultivates the vibrato at the expense of great effort and vastly increased difficulty in performance attests its desirability in the highest of instrumental arts.

*Its Conflict with Precision:* The fact that the vibrato is a clearly preferred alternative to precision and smoothness in tone in the face of the violence that it does to intonation, melody, and harmony testifies to its great worth.

*Its Place in Tone Quality:* The fact that in the best musical hearing the vibrato is not thought of distinctly as a pulsating affair but as flexibility, tenderness, and richness in tone quality, all of which are regarded as desirable, constitutes significant evidence of its place in the musical situation.

The most desirable average extent of pitch, intensity, and timbre, singly or in combination, is that which produces flexibility, tenderness, and richness of tone, *without giving undue prominence to the pulsating quality as such.* That is, the effect is good when it produces the desired tone quality, but does not make us clearly conscious of the fact that there are distinct waves.

An *extent* of the pulsation smaller than that defined in the above rule fails, in proportion to its smallness, to contribute toward the betterment of tone quality and a larger pulsation produces a bad vibrato, usually a tremolo.

Freedom from *irregularity* in extent or ratio within a given tone is essential to a good vibrato. As in all motor skills, the inceptive stages are irregular. The extent may be large or small: it may increase or decrease within a single tone or in a succession of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tones, but the change must be gradual and smooth. This rule applies also to the part-time or intermittent use of the vibrato on a single tone, which is always an indication of inadequacy.

Artistic performance demands *variation in extent and rate* throughout a performance. A uniform vibrato, even in the most perfect form, becomes monotonous and fails to function in phrasing, interpretation, and expression of the individuality of the performer.

The most desirable *average rate* is that which causes the best fusion of tone quality in sonance without producing a chattering through excessive rate. The faster the rate the more completely the fusion takes place in sonance within a medium range of tolerance. High rate introduces a new element; namely, chatter, which takes the place of pitch wave. Slow rate not only fails in producing fusion, but makes the wave movement more prominent.

In vocal vibrato the pulsations in pitch should be primary and dominant. This is true primarily on the ground of its near universality in good singing, but also on the ground of its relative prominence perceptually in the most refined vibrato.

The combination of synchronous pulsations in the three media makes a larger contribution toward tone quality than its occurrence in one or two.

In instrumental music, relatively pure intensity pulsation is permissible, as in organ stops and in the use of beats within a region of tolerance for rate.

In solo parts, both vocal and instrumental, the artist has larger latitude for giving prominence to the vibrato than he has in ensemble. This rule holds particularly for instrumental performances and, more specifically, for all other than the string instruments.

The more nearly alike the timbres of the instruments within an orchestral choir, the greater may be the demand for the vibrato in that choir.

A *bad* vibrato is one which is excessive or erratic in the extent of pulsation in pitch or intensity. There is, of course, more bad vibrato than good in music on the same principle that a comedian says, "Black horses eat more than white horses because there are more of them," and also because of the relative difficulty among individual singers of producing a good vibrato. Of course we dislike a bad vibrato and should discourage it, but that is no excuse for rejecting or disliking a good vibrato.

Scarcely any two persons hear a given vibrato alike. The reason for this lies in certain facts of individual differences, among which the following are conspicuous:

*The Vibrato Ear*: As in pitch discrimination or hearing ability, one person may be a hundred times as keen as another person in his capacity for hearing the presence of the vibrato or vibrato differences. This presents a most embarrassing problem to the performer, and, hence, a very great confusion as to what is good and what is bad in the discussion among individuals in the audience. These gross individual differences in what we may call *vibrato ear* or *sense of vibrato* prevent us from saying that a particular vibrato is ideal, good or bad without specifying for whom it is so. Ordinarily we may aim at a particular group type; such as, the fine musical ear, the average ear, or the crooner-saxophone ear.

*The Feeling-Response*: One thing that is as important as the ear is the natural and temperamental feeling-response or the emotionality of the listener. So far as the arousing of feeling is concerned, the majority of persons in a normal population shed the artist's outpouring of a beautiful tone as a duck sheds water. It has no meaning to them; it does not arouse the appropriate feeling, and is, therefore, largely lost. We have the technical word, *empathy,* to designate this trait of "feeling oneself into a situation." Musical empathy is one of the most essential elements of musical appreciation.

*The Attitude and Training*: The effect of attitude of the musician has been demonstrated in a shocking manner by the history of the attitude toward the vibrato—the inadequate and ridiculous descriptions that have been given, the fanciful explanations, the mystical implications, the groundless musical criticisms, the ill-directed and wasteful musical pedagogy as affecting the vibrato. These musical tragedies have their common root in the absence of correct knowledge of the nature of the vibrato.

*The Listener's Mood*: In addition to all the above variables, we have learned to take into account the point of view of the listener, and have distinguished between the critical mood and the musical mood. Both are legitimate and essential, but each yields quite different results. The former must prevail largely in training periods and in critical activities; whereas, the latter should prevail in the normal musical situation in which the object is the derivation of pleasure.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

We are dealing with aesthetics, and aesthetics is analytical and critical throughout. Therefore, in speaking of norms of beauty, indifference, or ugliness, we must confine ourselves to that which can be observed or felt in the critical mood. In view of these facts, it is clear (1) that what makes a good vibrato or a bad one is to be answered in terms of the extent to which it serves its purpose of contributing the three specifically named elements of feeling value to the tone; (2) that there can be no single standard of good- and the feeling value depend upon the listen- and the feeling value depend upon the listener's *"sense of vibrato"*; (3) that norms for best current practice are available and applicable: and (4) that there is abundant room for improvement beyond these norms in the direction of an ideal vibrato for the fine musical ear.

There are three stages in ear training for the vibrato: (1) factual information, such as musical terminology and nomenclature, analysis of the problem, demonstration of specific aspects: (2) practical exercises in the recognition, description, and evaluation of elements involved in each skill; and (3) drill exercises for the development of speed and accuracy in each operation. The mastery, appreciation, and feeling is really the ultimate goal in ear training. Only after these three stages have been pursued thoroughly can we undertake to master the rendition of the vibrato in voice or instrument.

As to a general theory for *training in the vibrato*, we may suggest the following considerations:

Wherever a student of voice has natural capacity for singing with feeling, *the vibrato has come in automatically*. Therefore, the problem with the musical student is not how to inject the vibrato but how to modulate it.

This modulation should take place not through conscious innervation of particular muscles but through the exercise of censorship of the ear which has been refined for hearing of the vibrato by exact knowledge of its nature and variables and by the acquisition of skills for the hearing, evaluation, and feeling each variable in turn.

However, a part of this orientation for the vibrato is knowledge of the musculatures and various physiological factors which determine rate and extent of vibrato. But the point here made is that the modulation of the vibrato will gradually take care of itself when the ear and the aesthetic judgment have been trained.

On the basis of cumulative experimental evidence, I would predict that an approach to an ideal vibrato for a fine musical ear may be found in the direction of enhancement of tone quality by a slight increase in the rate of the vibrato over the average rate now prevailing, and a very material reduction of the pitch and intensity extent. What would it mean to the musical world if our great singers were to reduce their vibrato to the extent now prevailing in the violin? See C. E. Seashore, *Psychology of the Vibrato in Voice and Instrument*. —C.E.S.

**vibrator.** See ACOUSTICS.

**vibratory movement.** See quality.

**violin family (violoncello, etc.).** See MUSICAL INSTRUMENTS.

**virelai.** See MEDIEVAL MUSIC.

**virga.** See MEDIEVAL MUSIC; neumes.

**Virgil practice clavier.** A "dumb" piano.

**virginal.** A small type of harpsichord. See MUSICAL INSTRUMENTS.

**virgin parchment.** *Book.* Parchment made from the skins of newborn lamb, calf, kid.

**virgin wool.** Wool that has never been previously spun, woven, knitted, felted or otherwise made into a manufactured product.

**viridian.** Called also transparent oxide of chromium, verte emeraude, and Guignet's green, this pigment is a fairly modern contribution to the art of painting, having been first put on the market in 1838. It is a slightly bluish green, useful in both oil and water color, and stable under even extreme conditions of exposure to light and to chemical reagents. —G.L.S.

**virtuosity.** See virtuoso.

**virtuoso** (L. *virtu,* excellence, strength, courage, virtue). A person who excels in the technique of an art, especially a performer on the violin, the piano, or any musical instrument. Used occasionally in the graphic and plastic arts to describe one whose technical facility or skill in the use of a medium excels his conceptual power or originality of expression to such a degree as apparently to become an end in itself. Thus many Hellenistic sculptors or 17th and 18th cent. baroque and rococo painters, sculptors, and architects may be said to be characterized by "mere virtuosity." —L.D.L.

**viscose rayon.** The third method (historically) of producing rayon filaments and by which about 83 per cent of the world's rayon was produced in 1938. The product by this method is regenerated cellulose, which has been coagulated or solidified from a solution of cellulose xanthate. —G.W.R.

**Vishnu.** In Hindu religion, *the Preserver,* and second god of the triad.

**Visigothic architecture.** See SPAIN, ART OF.

**visorium.** See amphitheatre.

**Vistula Gothic.** See POLISH ART.

**visual and space arts.** A term used by artists, authors, and art educators to embrace the entire field of art variously designated as "visual arts," "space arts," fine, industrial, and related arts; introduced into the nomenclature of art education in an attempt to coin a term that would avoid the distinction implied between fine and not fine, practical and impractical, or useful and non-useful concepts of art; includes the following areas of study: art appreciation, architecture, sculpture, painting, industrial art, graphic art, advertising art, domestic or household art, civic art, theatre art, and history of art. Whitford and Winslow in *Dictionary of Education.*

**visual angle, cone.** See PERSPECTIVE.

**visual form.** See PSYCHOLOGY OF ART.

**visual instruction.** Instruction in which a great variety of illustrative materials may be utilized as aids in pupil understanding or appreciation, such as lantern slides, models, and specimens. Whitford and Winslow in *Dictionary of Education.*

**vitreous enamelling.** See ENAMELLING ON METAL.

**vividness.** See LITERARY CRITICISM.

**Vladislav Gothic.** See CZECHOSLOVAKIA, ART OF.

**vocabulary, musical.** See idiom A.

**vocalization.** The art of singing prolonged and sustained vowel sounds.

**vocational art.** Any art serving an occupation or means of livelihood. Whitford and Winslow in *Dictionary of Education.*

**voice, leading.** See idiom C (4).

**voile.** A transparent, clinging fabric which

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is dainty and durable. May be made of any one or a combination of twisted cotton or rayon yarns.

**volté.** See galliard.

**volume, a.** *Book.* A bound book complete, or part of a whole. Generally, *but not always,* having its own title page and register.

**volume color.** See COLOR.

**volume creation.** See SCULPTURE.

**volume, negative, positive.** See SCULPTURE.

**volutes.** In Greek and Roman architecture, the spiral scrolls of the Ionic capital; also the small scrolls of the Corinthian and composite capitals.

**volute-crater.** See crater.

**vomitorium.** See amphitheatre.

**Vorschlag** (Ger.). See appogiatura.

**votive tablets.** Generally, ornamented and inscribed stone markers signifying devotion or fulfilment of a vow.

**voussoir** (Fr.). Any of the wedgeshaped pieces which constitute an arch or vault.

**vulgar sociologism.** The term now used to characterize that trend in the philosophy of art and esp. in literary criticism which predominated in the Soviet Union in the early 30's and which has been rejected in favor of the concept of socialist realism (q.v.). The older tendency was to interpret art and cultural productions generally as a reflection of the class consciousness of the author and to "explain" art mechanically in terms of sociology alone, without taking into consideration its unique qualitative richness, and without explaining why certain works of art have an appeal enduring through centuries. The older view also tended to search classic works for an expression of the personal, consciously held views of the author on social questions, and to confuse an evaluation of such views with a critique of the art. Some of the advocates even went so far as to hold that in communist society the works of even the greatest poets of the bourgeois epoch, like Shakespeare, for example, would no longer have any significance for people.

**wainga.** See AUSTRALIAN ABORIGINAL ART.

**Wakakusa yaki** (Jap.). Pottery made in Yamato province.

**wakasnuri** (Jap.). Mottled lacquer ware. Overlapping colors, black, white, gold and silver, rubbed down to produce a level surface cloudlike or mottled in effect.

**wakizashi** (Jap.). Short sword. A companion weapon worn with the long sword, *katana* (q.v.), by the *samurai.*

**walling wax.** A kind of wax used in etching to form a miniature wall or bank round the edge of a plate to hold the etching acid, etc.

**wall painting.** A picture painted on a wall such as fresco, oil or tempera.

**walnut oil.** Among the oils used as mediums for painting, this seems to have been much favored in the latter part of the Renaissance in Europe. It is mentioned by Armenini, Bisagno, Borghini, Leonardo da Vinci, Lornazzo, Vasari, Volpato, and others. It comes from walnuts which are oil to about 65 per cent. It dries rather more slowly than does linseed oil and it is less apt to discolor and to crack on drying. —G.L.S.

**Wanderers, The.** See RUSSIAN ARTS.

**warm colors.** See COLOR.

**warp.** Threads running lengthwise of the fabric, always in two series. In the loom, each series is connected to a heddle. The heddles work up and down, causing the warps to cross at the moment that the shuttle is thrown across the loom carrying the weft. —B.E.J.

**Warsaw, school of.** See POLISH ART.

**washing.** *Cer.* Process of purification by levigation, settling or lawning. See CERAMICS I.

**water color.** The art of painting on paper with a medium whose solvent is water. A process of painting with transparent or semi-transparent washes which distinguishes the medium from other types of painting. The colors are usually mixed with gum which acts as a binding medium.

Although this type of painting has developed mainly in the last hundred years, it was used by the Egyptians on papyrus rolls. In the medieval period illuminated manuscripts were painted with a water color medium.

The practice of water color as it is used today developed out of the drawings executed in various mediums from the 15th to the 17th cent. These wash drawings were usually made with pen and ink and a brown wash was used to indicate the volumes. Many drawings of this type were done by Rembrandt.

Water color painting developed rapidly in England with the work of Paul Sandby and John Cozens. The progress of development was from monochrome through neutral tints to full color. J. M. W. Turner was one of the first to employ a full range of colors in his water colors.

Since the time of Turner water color has become a separate and distinct art form employing various drawing mediums such as pencil, charcoal, ink, crayon, or pastel which are then gone over with washes ranging from transparent to opaque. The type of paintings made with opaque water color are often referred to as gouache (q.v.) drawings, esp. when a pliable adhesive is added to the binder to give the surface a soft sheeny quality. See PAINTING. —R.L.W

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**water-glass.** See stereochromy.

**water-marks.** (1) Patterns in paper made by wires set in designs in the screen on which the paper sheeting is formed have been called water-marks or paper-marks. These are not found in Oriental papers or in those of Arabian manufacture. They appear in European papers at the end of the 13th cent., particularly in products of the mills of Bologna and of Fabriano. Various designs have been used, at times the maker's full name. (2) *Book.* The design, etc., in the sheets of paper denoting maker, the mill at which it was made, or the size, introduced when the paper is in a pulp stage.

**water-organ.** See mechanical instruments.

**wattle.** *n.* A frame of poles and twigs platted together. *v.* To weave or twist, as twigs, into a network. (**Wattle-and-daub construction:** A wattle, or frame of poles and twigs platted together and covered or daubed, as with mud or plaster.) —J.M.M.

**wattle and daub construction.** See daub; wattle.

**wave molding.** A type of molding developed in the English decorated period consisting of adjacent convex and concave surfaces, sometimes compounded with other forms.

**wave ornament.** A highly conventionalized wave motive. Generally a repeat pattern of overlapping curves.

**wax.** Long known in the arts as both a molding and a surfacing material, wax has a variety of sources. All waxes, chemically speaking, are esters of monohydric alcohols, being different in that respect from oils which are esters of a trihydric alcohol. Paraffin, derived from shale oil, lignite, and petroleum, is similar in its source to montan wax which comes from lignite and from peat. Other common waxes are beeswax, Chinese insect wax, candelilla wax, and carnauba. These differ somewhat in hardness, plasticity, and melting point. As a coating material, wax in some form has been known since the earliest records of the arts. Sculpture and modelling in wax were common in the Renaissance, and at various times wax has been taken up as a painting medium. One such time was the early part of the Christian Era in the Fayum district of Egypt where mummy portraits were made with this as a vehicle for the pigment. —G.L.S.

**wax sculpture.** Owing to its pliancy and its readiness to absorb various dyes wax is particularly suited for two frequently associated purposes in art: (1) for the creation of images in the service of transitory needs, images which may or may not be destroyed after having been used. Examples: the effigies used in image magic. (2) For the creation of credible counterfeits of reality with the intention of deceiving the eye of the spectator. Examples: mannequins or Mme. Tussaud's waxworks. In order to render the illusion more complete the effect of the sculptured and properly colored parts of such an effigy may be heightened by the addition of real human hair and of human garments. The influence of wax sculpture upon art corresponds to the two extremes of its technical application. It leads either (1) to perfunctory sketchy treatment just sufficiently detained to assure recognition of the objects represented or (2) to the most meticulous realism. The latter is well attested in the case of Roman portraiture which arose from the imitation in more durable materials of the wax effigies used in family cults and in the ceremonial of funerals. —R.B.

**wa-yo** (Jap.). See JAPANESE ART.

**weathering.** The slope given to offsets, to buttresses, and to the upper surfaces of exterior features, to throw off rain.

**weaving.** The interlacing of the warp and **filling** (weft) to produce a fabric. In a strict technical sense only fabrics produced on a loom are called woven. All woven fabrics are composed of two or more systems of threads known as warp or ends and filling, weft or picks. The warp and filling threads are interlaced with each other at right angles. The manner in which these threads interlace with each other determines the weave.

All woven fabrics are divided into four main classes: **Single fabrics** having one warp and one filling; **compound fabrics**, having more than one warp or filling or both; **pile** or **plush** having a pile or nap of either warp or filling on the surface of a single or compound fabric; **gauze** or **leno** in which the warp thread in addition to interlacing with the filling threads is twisted with threads of its own system. **Lappet** and **swivel** weaves are sometimes classified in this fourth group, but because they both represent special methods of decorating a single or a compound fabric by means of extra threads, they may be

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

classed as a compound fabric. All weaves are derivatives of one of the **foundation weaves** which are **plain weave, twill weave,** and the **satin weave.**

There is only one **plain weave,** and it completes itself on two ends and two picks and may be woven on a two-harness loom. It is the most closely interlaced of all weaves and is used more often than any other. In cotton goods it is called the **cotton weave,** in linen, the **linen weave,** in silk the **taffeta weave.**

**Twill weaves** are numerous; all produce diagonal lines on a fabric. The smallest twill weave completes itself on two ends and two picks. By the use of more ends and picks (to the capacity of the loom to reproduce them) larger and more elaborate twills are made. Twills have special names as **Prunella, Cashmere, Jean, Jeanette** and **Genoa.** Four harness filling twills are known as **Swansdown twills, serge weave, blanket weave, Shallon** and **Cassimere twill** are well known names.

**Satin Weaves** do not have the lines found in twills. They have a smooth surface. Satin weaves are used in high textured fabrics. **Sateen** is a stout lustrious cotton fabric woven with a satin weave.

**web.** The continuation of the insertion of weft threads beyond the extent of the pile, to form a securely finished end of a rug, and also act as a protection for the end of the pile. —B.E.J.

**Wedgewood ware.** See CERAMICS II.

**wedging.** Process of working or kneading clay by hand. See CERAMICS I.

**weft.** The weft is a thread shuttled through the fabric crosswise of the loom between the warp threads. The weft serves to tie-in the yarn that forms the surface tufts or loops. The number of rows per inch is indicative of the closeness of the weave. —B.E.J.

**wei.** See CHINESE ARTS.

**well-tempered.** *Mus.* Tuned in equal temperament (see ACOUSTICS). *Well-tempered Clavichord* (*Wohltemperiertes Clavier*), title of Bach's 48 preludes and fugues.

**Werkbund, Deutscher.** See Deutscher Werkbund.

**West-Islamic art.** See ISLAMIC ART.

**wheel.** See GLASS AND GLASS-MAKING.

**Wheel of the Law.** In Buddhist art, an eight-spoked wheel symbolizing the eight-fold path of Buddha's teaching. See *cakra* (Skr.). See SYMBOLISM IN FAR EASTERN ART.

**wheel window.** A round window with mullions radiating from the center like the spokes of a wheel.

**whelk red.** See Tyrian purple.

**white lead.** The basic carbonate of lead, containing ordinarily about 70 per cent of lead carbonate and 30 per cent of lead hydrate, has been by far the most used white pigment in the history of the painting art. It was one of the first artificially prepared pigments, and methods for its preparation were described by Theophrastus, Pliny, and Vitruvius. Numerous medieval recipes for its manufacture are recorded. Most of these involve the exposure of strips of metallic lead to the fumes of vinegar in some way combined with vapors of fermentation to introduce carbon dioxide. Although generally stable, white lead is darkened if in a lean tempera or aqueous film when exposed to hydrogen sulphide in the air, even in low concentration. This accounts for much of the blackening of the white touches used on Renaissance drawings and probably explains why Far Eastern painters never adopted this pigment for general use. —G.L.S.

**white porcelain.** See CERAMICS I.

**white spirituals.** See American folk forms, in music.

**white tiger.** See SYMBOLISM IN FAR EASTERN ART.

**whiting.** This name is commonly given in the trade to powdered chalk, natural calcium carbonate, generally used in painting grounds and in grounds for gilding. See chalk. —G.L.S.

**whole rest.** See NOTATION.

**whole step, whole tone scale.** See scales and modes.

**Wiener Keramik.** See CERAMICS II.

**wild flower sanctuary.** A tract of land especially devoted to the propagation and protection of wild flowers under natural conditions. See CIVIC PLANNING.

**wild life sanctuary.** See CIVIC PLANNING.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**wild man (wild folk).** Representation in Western medieval art of men and women whose bodies are covered with long hair. Derived from native pre-Christian folklore wild men are conceived as dwarfs or giants, as uncivilized, as intimately allied with the life of forests and as demonds of fertility. Consequently they are used in art as symbols of lust and progeny (holding coats of arms). Frequent in drolery (q.v.) from late 13th to early 16th cent. —R.B.

**Willendorf figure.** See PREHISTORIC ART.

**William and Mary style.** See EARLY AMERICAN ART.

**Wilno neo-classicist school.** See POLISH ART.

**Wilton carpet.** A Wilton weave derives its name from the fact that it was first woven in the town of Wilton, England. This weave is the one which is generally known as having the buried or hidden values and quality and is therefore generally in the higher price range. By this is meant that a portion of the yarn used in the rug is buried in the back, adding resiliency and quality to the carpet. The Wilton weave is made in two types, the worsted Wilton and the wool Wilton. The worsted Wilton offers the greater possibilities as to fineness of design and texture, whereas the wool Wiltons is more luxurious under foot, owing to its greater depth of pile and softness.

The difference between the worsted and wool Wilton is really seen by comparing the general appearance and difference in the depth of pile in the two types of fabric. The tufts of the worsted Wilton are very resilient and stand up straight, as is easily noticeable, and give the appearance of velvet. It is on account of this stiffness that it is possible to produce a velvet-like yarn and obtain fine detail in the design.

The construction of the wool Wilton is heavier, esp. in the back, as the yarn is coarser in twist, and it is also buried in the same manner as in the worsted Wilton. A genuine Wilton must be woven by the Jacquard process. Any carpet or rug not so woven is not a Wilton. In all essentials the Wilton is still loomed by the method given to the world through the genius of Joseph Marie Jacquard, plus the addition of the power drive.

While generally in the past this weave has been made in the better qualities, it is possible to produce "Wiltons" that are less expensive than high grade axminsters and velvet weaves. —B.E.J.

**wing.** A side building, attached to, but usually of less importance and size than the main building.

**wiping.** *Etch.* In preparing an intaglio plate for printing, the etching ink is spread on the entire plate and is then wiped off the surface, leaving the ink only in the lines. Done by wiping the warm plate with a stiff tarlatan rag to produce a rage-wiped print or finishing the wiping of the plate with the palm of the hand to produce a hand-wiped print. See PRINTS AND PRINT PROCESSES. —K.K.

**wire-marks.** In the process of making paper by hand a wet pulp of fibre is formed into a sheet on a screen of wire, the deckle. The pulp in settling is slightly thicker in the interstices of the wires than over them and by transmitted light shows this pattern called wire-marks. These are further specified as laid lines and chain lines. —G.L.S.

**wire sewing.** *Book.* Stitching the sections of a book.

**wisecracks.** *Quip* is the older word; *gag* is the theatrical equivalent. As a "jocular smart remark", the wisecrack resembles the epigram rather than the proverb, although many wisecracks originate in parodies of proverbs, contain proverbial phrases, or pass into proverbial usage. In its ephemeralness and desire to be different the wisecrack is the rhetorical counterpart of slang. Strictly, like slang, it belongs to the popular rather than the folk level of usage; but like slang, it is constantly playing back and forth between written and unwritten tradition and between individual and group invention. The lore of the wisecrack, like that of slang, is for the most part an urban and sophisticated lore. In its instability, its pattern of formula and variation, and its creation of folk metaphor, it is, if not folklore, at least "folklore in the making."

Almost every form of wit and rhetorical device is employed in the wisecrack: puns, malapropisms, boners, and other varieties of word play and humorous mistakes. (She was so dumb she thought a subordinate clause was one of Santa's offspring; He is a big needle and thread man from So-and-So; She is not my best girl—just necks best; Lettuce is a proposition); Wellerisms (As the pencil

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sharpener said, "Now to get down to the point"); Irish bulls and paradoxes (I couldn't commit suicide if my life depended on it; She would be cute if it wasn't for her face); extravagant impossibilities (Yours till elephants roost on rose bushes); nonsense (More fun than I've had since the day the cow catcher had a calf); exaggeration (She was so thin that she could fall through a flute and never strike a note); the fabulous or the tall tale (It was so cold the cows gave ice cream); *reductio ad absurdum* (If steamships sold for a nickel, I couldn't buy the echo of a whistle); *non sequitur* (Let's you and him fight until I get tired).

The use of the formula is basic to the wisecrack: so dumb, so tight, you tell 'em, they call, she was only, you don't have to, you may be. Certain formulae are identified with disparaging or insulting wisecracks which may be called "slams" (They call her a toe dancer because she dances on other people's toes; You don't have to hang from a tree to be a nut; You may be bread in old Kentucky but you're just a crumb around here).

The habit of wisecracking is related to the American trait of "laughing it off" and to the love of mottoes and slogans. Many trade slogans are nothing but wisecracks: We wash everything but the baby; You can whip our cream but you can't beat our milk; You furnish the girl, we furnish the rest; Look at your hat, everyone else does; Why kill your wife? Let us do the dirty work; You wreck 'em, we fix 'em. See *The People, Yes,* by Carl Sandburg, 1936; *10,000 Jokes, Toasts & Stories,* by Lewis and Faye Copeland, 1939. —B.A.B.

**Wistar glasses.** See GLASS AND GLASSMAKING.

**wisteria.** See SYMBOLISM IN FAR EASTERN ART.

**Woelfflin method of classification.** See PAINTING.

**wood.** The fibrous structure of trees and similar plants has had a multiplicity of use in the arts. As a solid material, it has been the substance of many sculptures and of innumerable objects. It has served as handles and as tools for designers and craftsmen, as supports for painting, and as blocks for printing. In all cases the bulk of wood fibre is cellulose and the structure is cellular, muhe like that of a honeycomb. Wood is principally characterized by its dimensional changes corresponding largely to changes in moisture content. It is this which makes it warp and, on extreme drying, check and crack. It is subject also to deterioration from the attacks of insects, beetles, and termites, and by parasitical growths such as the dry-rot fungi. Technically, woods are classified into two large groups: the hardwoods, characterized by a certain large cell called a pore or vessel; these hardwoods are further differentiated into a ring-porous group such as oak, ash, and elm, and the diffuse-porous group such as maple, black walnut, and yellow poplar. In the former the spring-wood pores are generally large compared to those of the summer-wood and annual rings are easily visible. Softwoods have fibre-like cells or tracheids instead of pores. The name is slightly misleading because all of the technically called softwoods are in reality soft. They come from needle—or scale-leaved trees, most of them bearing cones. —G.L.S.

**wood block.** A die cut from wood, used for making impressions on paper or on fabric.

**wood block print.** An impression from wood block on paper or on fabric. In the Orient the flat of the block is used as the surface to be cut.

**woodcut.** See PRINTS AND PRINT PROCESSES.

**wood engraving** (in woodcut). See PRINTS AND PRINT PROCESSES.

**wooden tiger.** See MUSICAL INSTRUMENTS.

**wood-pulp.** Broken up fibres of wood are used in the manufacture of cardboard and of paper and in many of the artificial building boards. All of these materials have had some use as supports for painting. In general, wood-pulp as such is either mechanical, in which the fibres are separated by grinding and soaking, or chemical, in which the fibres are separated out of chips by the action of alkali or acid solutions. See paper. —G.L.S.

**wool** (Skr. *urna*; L. *lana*; Gr. *lenos*). The soft curled or crisped covering or coat of the sheep.

How the knowledge of shearing wool came to our ancestors is lost in the mists of antiquity. We have account books dated 2200 B.C. telling of the weavers of Ur who were working for the priests of the temple. On

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

clay tablets are the records of the weavers and the amount of wool each one received.

It is thought that in the Paleolithic period man plucked the tufts of wool left on the bushes by wild sheep and discovered, perhaps accidentally, that with his fingers he could twist it into a strong cord. The cord had many uses. Felt and cord were the first results of processing wool.

Mesopotamia is the country of wool production and wool weaving. The Babylonian loved the heavy luxurious folds of wool material. About 1800 B.C. heavy goat skins were worn as a skirt. From cuneform inscriptions from Asia Minor, we learn that at Assur, centre of the Assyrian Empire, the merchants were organized into Guilds, very much as the merchants of the medieval period were organized. The wool business was their major concern. There is no doubt that the raw material of the Babylonian and Assyrian textile industries was wool. (Linen was also used. Fragments of linen have been found at Susa.) Draperies and tapestries as well as clothing were made of wool. In the Assyrian period the dress seen on the stone reliefs were long tunics with short sleeves worn with a fringed shawl. Elaborate knotted fringe and tassels finished the bottom of these tunics over which leather belts were worn. These dresses were ornamented with geometric designs, rosettes, the "Tree of Life", and human figures. These patterns may have been woven or embroidered. We read of purple, blue, dark red, red yellow, and red brown fabrics.

There are many records of trading in wool with Phoenicians. Very little wool was used in Egypt until the Coptics (Egyptian Christians) wove their wonderful fabrics using linen and wool. The Doric Greek chitons (long tunics) were made of wool. The heavy folds and strong lines of the **apotygma**, with its overfold at the top suggesting a blouse, is seen in Greek sculptured figures. Later the Greeks used linen which gave the finer, sharper folds seen in the sculptured figures of Ionic and Corinthian sculptures.

The Romans used wool for their tunics and togas. (Linen and a very small quantity of silk were used in the *clavis*.) The Romans bred sheep for fine long staple wool, the Roman sheep being the ancestors of the Spanish merino wool bearing sheep. (The merino sheep are the parent stock of all the fine wool sheep of Europe, America and Australia.)

At the end of the 13th cent. England was the great wool producing country of Europe. They furnished the weavers of Flanders with wool to such an extent as to tend to keep the peace.

Sheep were first introduced into America at Jamestown in 1609. President George Washington imported the best breeds of sheep from England and promoted the bringing to America of the best spinners and weavers from England.

In 1801-1812 Colonel David Humphries imported merino sheep from Spain, which were sold to the Connecticut farmers. —G.W.R.

**wool, artificial.** All types of cellulose and non-cellulose materials made to imitate the wool fibre and its valuable physical and chemical characteristics. Some of them are "Sniafil", "Lanusa", Casein fibre, etc. —G.W.R.

**Worcester porcelain.** See CERAMICS II.

**work forms.** See FURNITURE.

**work habit.** (art ed.) Procedure in art which has been established, become semi-automatic, or automatic through repeated use. Whitford and Winslow in *Dictionary of Education*.

**workmanship.** Technical skill applied to the execution of a piece of art work. Whitford and Winslow in *Dictionary of Education*.

**work period.** (art ed.) Time provided for the carrying on of art activities, connected with an integrated unit of teaching. Whitford and Winslow in *Dictionary of Education*.

**workshop.** (art ed.) A place in a school building provided for carrying on art activities. Whitford and Winslow in *Dictionary of Education*.

**World of Art group.** See RUSSIAN ARTS.

**world planning.** See CIVIC PLANNING.

**worsted yarn.** The long, straight fibres combed out of wool, twisted together on high speed spinning frames. A slender, hard, lustrous type.

**woven felt carpet.** See carpet structures.

**wreath.** In Roman art, an ornament consisting of an intertwined rope of flowers or leaves forming a circle. Also see HERALDRY.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**"wrecks," repainted.** See FORGERIES IN PAINTING.

**wrinkling.** See CHINESE ARTS.

**writing** (verbal noun of to write, Old English *writan,* to incribe). (1) The use of conventional symbols for the recording by visible means of ideas or of significant sounds; (2) the art or act of tracing by hand such symbols on paper or other material with pen and ink or other writing tool; (3) the product of the art and act of writing.

Writing of all kinds is the subject matter of the science of **paleography,** although inscriptions on, or in, hard materials, which are not writing in a strict sense (see LETTERING), are assigned to a branch discipline known as **epigraphy,** and thus the term paleography is commonly restricted to the study of writing on less durable materials. Materials used for writing have varied with time, place, and use. In western civilization the principal materials have been papyrus in the ancient world, vellum and parchment (in general use after 400 A.D.) during the Middle Ages, and paper (after the 15th Cent.) for the modern world. The chief tool for writing has always been the pen, made in ancient times from a reed and in medieval and later times from either a reed or the wing feather of a large bird. The quill pen remained in general use until superseded in the early 19th cent. by the steel pen nib.

The style of writing also has varied with the intended use. In general three classes may be distinguished: **formal scripts** used for books; **semi-formal scripts** (the **legal hands,** i.e., **chancery, charter, bastard,** and **secretary**) for documents; and **cursive scripts,** the ordinary running hands, for everyday private use. Formal writing acquires its character (1) from being done with a chisel-shaped pen, which, because of its form and not from variation of pressure in its use, produces wide and narrow strokes; (2) from being written deliberately, each letter being composed of several separate pen-strokes, with the pen lifted from the paper after each stroke; (3) from having the heads and serifs built up of several strokes. Cursive writing on the other hand is done (1) with a pointed pen which produces the running character of the hand (2) by remaining on the paper to form an entire letter or several letters with one stroke, and (3) which frequently ties several letters together in ligatures. Semi-formal scripts show in varying degrees an intermixture of these two contrary characters. It was this interplay of formal and cursive elements which produced the great variety of scripts in use in western civilization from the 1st cent. to the present time. Probably the most notable example of the process is the change from capital (**majuscule**) to small-letter (**minuscule**) script in which the influence of cursive tendencies on the capital letter-forms produced during the 1st to the 5th cent. A.D. the first of an entirely new genus of scripts. In the modern world formal writing has to a large extent, but not entirely, been replaced by printing from type; semi-formal writing has been superseded by typewriting; and only cursive continues to fulfill its historic role.

The materials, tools, and processes of formal and semi-formal writing are discussed in detail by Edward Johnston and those of cursive writing by Alfred Fairbank in his *A Handwriting Manual,* 1932. See also Edw. Johnston, *Writing and Illuminating, and Lettering,* 1906 ff. and *Decoration and Its Uses: in the imprint,* 1913; E. M. Thompson, *An Introduction to Greek and Latin Paleography,* 1912; B. L. Ullman, *Ancient Writing and Its Influence,* 1932. —E.F.D.

# X

**xoanon** (Gr. from *xeo,* to carve). A carved image, a sculpture, a statue. In early archaic times the Greek artists used wood as material for sacred images which were called "xoana". None of these primitive works have been preserved. In his work *Periegesis Hellados* (Description of Greece), Pausanias, the author of the 2nd cent. A.D., still mentions several such "xoana" which were held sacred and had escaped destruction to that time.

**yu** (Ch.). Sacrificial bronze vessel. Bulbous jar-form with cover and a swiveled bail. For holding sacrificial wine.

**yü** (Ch.). Bronze vessel, in the form of a large bowl with flaring rim and a base, and generally inscribed. See also MUSICAL INSTRUMENTS.

**Yuan art.** See CHINESE ARTS.

**yüan chin** (Ch.). Literally, far and near. Referring to perspective in landscape painting.

**yüeh ch'in.** See MUSICAL INSTRUMENTS.

**Yugoslavia, art of.** From the earliest times the Yugoslav groups were never able to achieve political unity. It was only in 1918 that the rising tide of feeling brought together the various South Slavonic lands which had started with the same fundamental inheritance in the days of paganism and had then been separated by cultural and political influences. This has not failed to have its effect upon the history of art but any attempt to separate the provinces would lead to extensive repetition of material created in various periods.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The territory of Yugoslavia, esp. the area along the Dalmatian coast, had formed an integral part of the Roman Empire. It was filled with Roman settlements and Roman remains such as the great palace of Diocletian in the city of Split. This was perhaps the largest monument of the country but it was by no means isolated.

After the Slavs appeared and took control of the country, there was a new outburst of art on Yugoslav territory which was far more advanced than was the Italian art of the same period. It may be questioned whether this new feeling was secured from Byzantium or from points east of the imperial city on the Bosporus. Perhaps it came from the original home of the Slavs and the forced creation of stone instead of wooden buildings. Yet long before the year 1000 there was a large number of church buildings on the east shore of the Adriatic, such as the Church of St. Donatus in Zadar and some of the Churches of Knin.

These buildings, of a type that may be called Byzantine, were gradually remodelled as the Slavs came more closely under the influence of Venice and the Papacy. We can begin to trace in them Romanesque and Gothic elements and in the north in Croatia Western influences, passing from the Crown of St. Stephen, joined in Italian influences of the Renaissance to produce something new. From the 12th to the 17th cent., the Adriatic cities were subjected to these Western influences which reached their height in Dubrovnik. The city was almost destroyed by an earthquake in 1667 but even after it was rebuilt, it was still one of the most perfect examples of the Renaissance with such gems of architecture as the Palace of the Ban, the Mint, and also the old churches.

Further to the north in Croatia, which was directly under the Crown of St. Stephen, and in Slovenia, which was under Hapsburg sovereignty, we find the combination of these forms with the typical Austrian forms of Gothic and it is this type that dominates the oldest buildings of Zagreb and even Lyublyana.

On the other hand in such provinces as Zeta, Rashko, etc., there was a definite preponderance of members of the Orthodox Church and the influence of Byzantine was a decisive factor in the creation of the Serb monasteries of the 12th, 13th and 14th cents., as the Monastery of Dechani and of Grachanitsa, the Monastery of the Archangel at Prilep and the Monastery of Ravanitsa which was built by Knez Lazar, the hero of Kosovo.

Perhaps in no part of Europe was there a greater development of frescos, even more than mosaics. Most of them are unfortunately in a bad state of repair and they have not yet had the careful study which they deserve. Painted in a somewhat stiff and formal style they still personalize and individualize all the leaders of the Nemanya and later dynasties, esp. St. Sava and some of the later secular rulers as Dushan.

The coming of the Turks broke down this flourishing art. The monasteries were burned and plundered and if they were restored, it was never to their former splendor and beauty. The Eastern influences in the decorating of the church and in the construction of dwellings and palaces turned largely into Turkish borrowings, while the more cultured classes were forced into exile or retreated northward across the Danube.

Thus it was not until the beginning of the 19th cent. when Serbia recovered its independence that the way was open for the introduction of a modern architecture and other arts in their modern form. In Croatia and the Roman Catholic provinces art passed through all the same phases which were found in Vienna and in Italy.

The first modern painter was undoubtedly Arsenij Todorovich (1768-1826) while the greatest artist of the period was Konstantin Daniel (1798-1873), a colorist of the first rank. The classical period was replaced about 1840 by a group of romanticists who preferred views of landscape or historical scenes. Still later they were followed by a group of realists after 1875 who became even more popular than were the earlier painters. Vlaho Bukovac and Paya Jovanovich secured a great following at this time because of their skill. Still other painters as Marko Murat began to develop in the pattern of impressionism. After 1912 all authors from all parts of the country really turned to France and the Parisian influence has been strongly felt by the younger artists. During this period there came steadily increasing relations between the Croat Roman Catholic and Orthodox Serb painters. They worked more and more on the same themes and the fundamental cultural divergence between East and West seemed on the way of being bridged.

Sculpture developed more freely in the Roman Catholic area, although there are surprising specimens of wood carvings scattered throughout the entire country. It passed

through the same general phases but in the person of Ivan Mestrovich, Yugoslavia found a genius of the first rank. Whether he is picturing his mother or the Balkan hero Marko, Mestrovich has produced striking figures with an independence of technique that separates him from most of his fellows and places his achievements above those of most modern artists. A still younger generation is endeavoring to combine his influences and those of other Western masters.

The confused political situation during the last decade before World War II led to the formation of new local blocs and there were energetic attempts again to disentangle the skeins of provincial culture and to recreate a Serb art, a Croat art, etc., but there were equally strong groups continuing to work toward a large unity. This local patriotism was complicated by Fascist, Nazi, and Communistic ideologies, which seriously hampered all development and often sacrificed art to political theories and other considerations. It remains to see what the future will bring forth, but with the exception of the works of Mestrovich, it must be admitted that the modern art has not reached the level of the medieval period. See *La Yougoslavie d'aujourd'hui,* Belgrade, 1935. —C.A.M.

# Z

**Zakopane.** See POLISH ART.

**zapateado.** A Spanish dance in which the rhythm is marked by the stamping of the dancer's feet.

**Zapotec.** A linguistic group living in the valley of Oaxaca, Mexico. They were the authors of a ceremonial civilization which had a pantheon, a calendar system, a method of writing, and they built great ceremonial centers. Their art is highly stylized, yet seems to have been influenced by Maya and Olmec and was later largely supplanted by Mixtec. —G.C.V.

**Zemiroth.** See JEWISH MUSIC.

**Zeus** (L. Jupiter). The classical "father of gods and men," supreme deity and sky-god, symbolized by a thunderbolt, sceptre and eagle. In early Greek sculpture and painting he was represented as an austere divinity, brandishing the thunderbolt; later he was thought of as a more benign god, an elderly "man of the world." The most famous statue of him was Phidias' majestic chryselephantine figure at Olympia; but there is an excellent extant bronze recently recovered from the sea and now in the National Museum in Athens. In later painting he was pictured by Correggio, and in sculpture by Cellini, Thorvaldsen, Iannelli, Jennewein and Aitken. —W.R.A.

**Zeze yaki** (Jap.). Pottery made in Omi province.

**ziggurat, zikurat.** See MESOPOTAMIAN ART.

**zigzag.** A continuous decorative pattern in which a line or band is broken into short sharp turns in alternating directions.

**zinc pigments.** The chief of these is zinc white, an oxide of the metal, first suggested for use as a pigment in 1782 and available on the market as an artist's color in 1834. During the early years of its production zinc white was made largely for water colors, but improvements in the manufacture allowed it to be satisfactorily employed with oil. It is weaker in its hiding power than the white lead which had preceded it for many centuries on the palette of the artist and weaker, also, than the titanium white which has come since. A bright, clear, lemon yellow pigment is made artificially from zinc and chromium and is known as zinc yellow. It made its appearance on the market in the middle of the 19th cent. —G.L.S.

**zincography.** A method of printing from zinc plates similar to lithography. The drawing or decoration is made on the plate, processed and printed. Sometimes a relief plate is made by etching the zinc plate. —R.L.W.

**zingaresca.** A gypsy song or dance.

**zo** (Jap.). Sculptured deity image.

**zoanon.** See xoanon.

**zogan** (Jap.). Inlaid work of gold or silver.

**zogan-nuri** (Jap.). A lacquer technique imitating cloisonné.

**zone, zoning.** See CIVIC PLANNING.

**zoophorus.** In classical architecture, a frieze of relief sculptured figures of men or animals or both, continuously arranged.
